

Figure 4.13: Map showing presence of sensitive visual receptors

The screening exercise entails the overlay of the above site selection principles to analyse which areas are visually sensitive, and accordingly, visually ideal, acceptable or restricted for the proposed development.

Table 4.4 below summarises the sensitivity categories utilised in this regard:

Table 4.4: Sensitivity analysis

Category	Description
Low Sensitivity	Preferred or ideal location for the proposed development with lowest visual sensitivity – complies with the positive criteria with no restrictions (negative criteria)
Medium Sensitivity	Acceptable or suitable location for the proposed development with neutral visual sensitivity – no positive criteria, but no restrictions (negative criteria) either.
