THE PROJECT TEAM

Mr Craig Sholto-Douglas, Faunal Specialist

Craig holds a BSc (Env Sci and Zoology) and a BSc (Hons) in Environmental Science. He is currently completing his MSc in Environmental Science, focussing on factors influencing survivorship of *Portulacaria afra* (*Spekboom*) cuttings, in attempts to restore degraded lands in the Greater Addo Elephant National Park. His academic background includes courses in Urban Forestry and Greening, Non-Timber Forest Products, Community-Based Natural Resource Management and Geographical Information Systems. Research projects include a leopard (*Panthera pardus*) population survey and invasive plant species analyses. Craig has consulting experience in the restoration ecology and natural resource management fields, with focus on the Subtropical Thicket Restoration Project (STRP). Craig has been involved in ECO work, EIA's and a number of faunal specialist studies in South Africa and Mozambique. Relevant experience involving faunal research include: Fairewood Estate Ecological Specialist Study; Ukomeleza Wind Energy Facility Ecological Assessment; PPC Mining Floristic and Faunal Scoping Report; Uhambiso Glen Hurd Road Upgrade Faunal Specialist Study; Kariega River Causeway Ecological Assessment; and Nxuba WEF Ecological Ground-truthing. Craig has conducted avifaunal studies for the Department of Environmental Affairs Quion Point Avifaunal Study; Metals of Africa Avifaunal Assessment, Montepuez, Moozambique; and Kenmare Minerals Faunal and Avifaunal Assessments in Mozambique. Craig has also conducted the post-construction phase bird and bat monitoring for the InnoWind Waainek Wind Energy Facility.

Michael Bailey MSc, Faunal Specialist and Report Writer

Michael is a Principal Environmental Consultant at EOH CES in Grahamstown, South Africa. He holds an MSc in Quantitative Conservation Biology from the University of the Witwatersrand, Johannesburg, and a BSc in Biology and Ecology from the University of Ulster (N. Ireland). He is a full member of the Chartered Institute of Ecology and Environmental Management (CIEEW). His professional interests are concentrated on ecological and wildlife conservation and development issues which involve wildlife population surveys, environmental impact assessments, mitigation strategies and monitoring programmes, as well as developing Biodiversity Action Plans (BAPs) and environmental management plans. He has been responsible for managing a number of large ESIA's involving agriculture, renewable energy, and mining developments, all in compliance with IFC Performance Standards, most recently in Zambia, Mozambique, DRC and Lesotho. He has also been the faunal specialist and specialist report writer for various ESIA projects with a particular focus on terrestrial fauna studies in Zambia, Mozambique, Uganda, Lesotho, Liberia and DRC. Most recently Michael has been managing Biodiversity Action Plans (BAP) and Stakeholder Engagement Plans (SEP) for Zambeef's Zambian operations at their five major agricultural production estates situated in Mpika, Mpongwe, Sinazongwe, Chiawa in the Lower Zambezi and Huntley Farm near Lusaka. Michael has also designed and conducted various research projects which range from field-based faunal surveys and monitoring programs in Africa and Ireland, to laboratory-based genetic research initiatives. In the last eight years Michael has had considerable international working experience in Africa and understands the national environmental legislation in countries such as South Africa, Zambia, Lesotho, Mozambique, Liberia, Uganda and Zimbabwe, as well the UK and Ireland.

Luke Kemp, Herpetologist

Luke is a B.Sc. Rhodes student currently working on a project to determine the effects of domestic animal grazing on reptile and amphibian diversity. Luke completed a FGASA accredited Standard and Advanced snake handling course as well as advanced first aid for snake bite through African Snakebite Institute. Luke has conducted reptile and amphibian surveys in the Northern Cape, Eastern Cape and Mpumalanga, mapping reptiles and amphibians and collecting samples for the Port Elizabeth Museum (Bayworld). Luke is currently on the panel of judges for reptile identification on the Animal Demography Unit (ADU). Although Luke has a predominantly herpetological background, he thoroughly enjoys his birding and is regularly involved in bird atlassing projects.

Ms Tarryn Martin, Ecological Specialist and reviewer

Tarryn holds a BSc (Botany and Zoology), a BSc (Hons) in African Vertebrate Biodiversity and an MSc with distinction in Botany from Rhodes University. Tarryn's Master's thesis examined the impact of fire on the recovery of C₃ and C₄ Panicoid and non-Panicoid grasses within the context of climate change for which she won the Junior Captain Scott-Medal (Plant Science) for producing the top MSc of 2010 from the South African Academy of Science and Art as well as an Award for Outstanding Academic Achievement in Range and Forage Science from the Grassland Society of Southern Africa. She conducts vegetation assessments including vegetation and sensitivity mapping to guide developments and thereby minimise their impacts on sensitive vegetation. Tarryn has conducted a number of vegetation and impact assessments in Mozambique (to IFC standards) which include the Lurio Forestry Project in Nampula, the Syrah Graphite Mine, Triton Ancuabe Graphite Mine and Nicanda Hills Graphite Mine in Cabo Delgado and the Baobab Iron Ore Mine in Tete, Mozambique. Tarryn has also co-designed and implemented the Terrestrial Monitoring Program for Kenmare, MOMA, a heavy minerals mine in Mozambique. This monitoring program includes an assessment of forest health. She has also worked on the Lesotho Highlands Development Authority botanical baseline survey for phase 2 of the Lesotho Highlands Water Project.

EXECUTIVE SUMMARY

EOH Coastal & Environmental Services (CES) has been contracted by Envirolution Consulting to conduct a specialist avifaunal study for the Gourikwa-Blanco 400kV Power line and Substations upgrade. The study comprised of both a desktop study and a field survey to investigate the potential impact of the proposed powerline and substation upgrades on the avifaunal communities and species in the area.

The project entails the construction of a 400 kV power line from the Gourikwa Substation at Mossel Bay to the existing Blanco Substation at George for which four alternative routes were assessed. Alternative 1 runs for 57km from the Gourikwa substation in a north-east direction following the Proteus-Droerivier 400kV line to the proposed Narina Transmission Substation. Alternative 2 runs parallel to an existing line south of the first option (Alternative 1). The third option, Alternative 3, is an alternative to Alternative 2 and initially runs east to Hartenbos along an existing line and then joins Alternative 2 on the north side of the Brandwag River. Alternative 4 was later proposed as an additional route option which utilises sections of each of the other three options whereby it follows the route of Alternative 3 to the point where it joins Alternative 2 and follows this route before turning north to join Alternative 1 approximately 20km from the substations at Blanco (Narina).

Five alternative positions for the Narina Transmission Substation have been proposed. Alternative 2 is at an existing substation and as such this will be upgraded to accommodate the proposed powerlines. Alternatives 1, 3, 4 and 5 will require the construction of a transmission station and the impacts associated with this will therefore be greater.

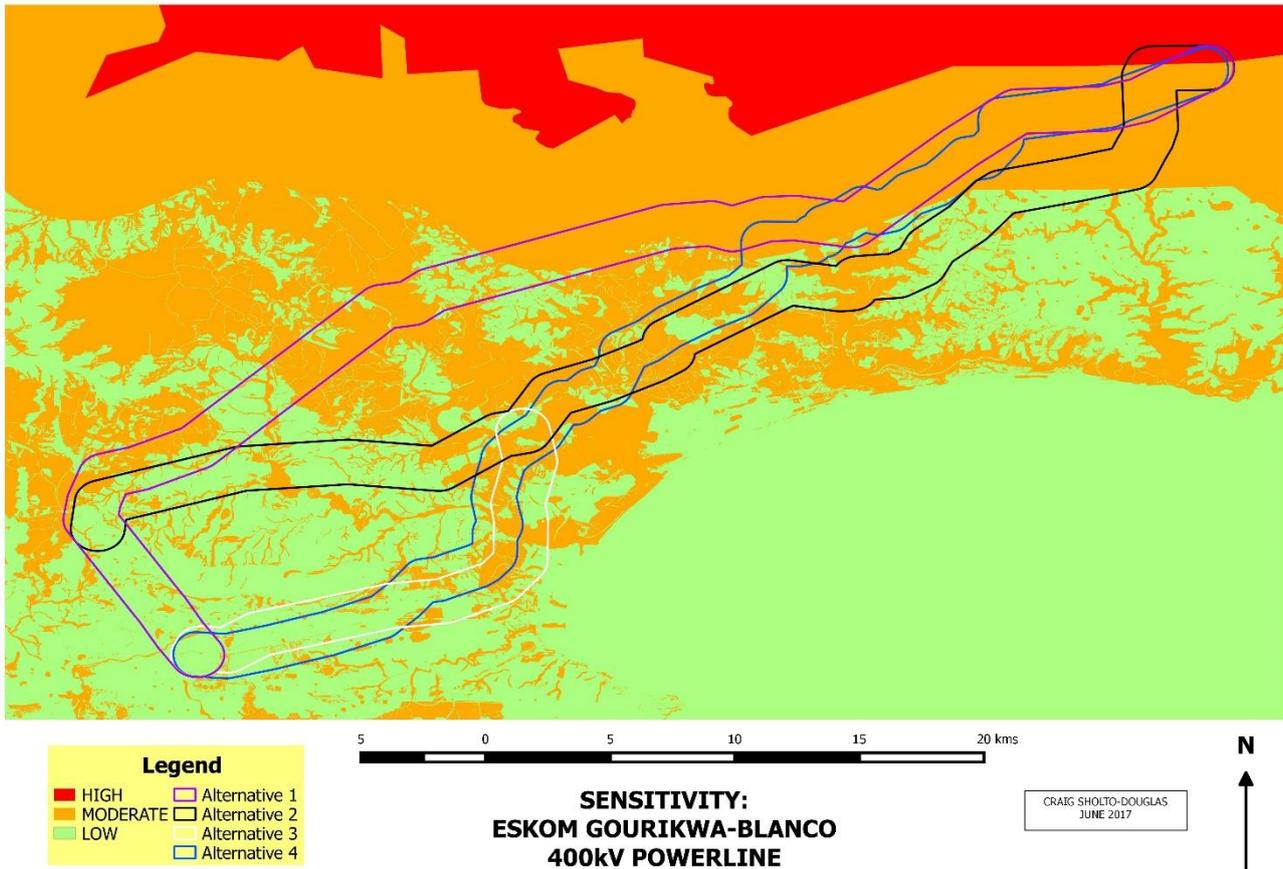

The study provides (i) a general description of the avifauna of the project area and adjacent areas, (ii) a review of the avifauna likely to occur in the project area, and likely presence of Species of Conservation Concern (SCC), (iii) an assessment of the habitat associations of the avifaunal components and the potential impacts associated with the construction and operation of the powerline and substations, (iv) and, where possible, provides guidance on the alternative routes based on the resident avifauna and their associated habitats. The investigation focused on a 1km wide corridor for each of the proposed alternative routes, the proposed Narina substations, as well as the larger project area to incorporate potential alignment changes.

To give insight into the avifaunal components of the project area, the desktop avifaunal assessment used spatial planning tools to identify protected areas and areas of special concern within the greater project area. Identified areas include Formal Protected Areas (NBA, 2011), Critical Biodiversity Areas, and Wetlands and Rivers (NFEPA). These were all mapped to spatially reference and relate these areas to the proposed alternative power line routes. BirdLife South Africa's Important Bird Areas (IBAs) was also consulted to map and identify bird priority areas within the project area.

According to historical records, 314 species of birds have distribution ranges which include or are part of the project area (SABAP2 2016). There have been 30 bird species of conservation concern recorded in the project area, of which four (4) are recorded as regionally Endangered (EN). Eleven (11) species have been identified as 'powerline priority species' for the proposed development. Powerline priority species are birds most prone to powerline (and associated infrastructure) impacts and include vultures, eagles, cranes, bustards, storks, and flamingos (Smallie *et al.*, 2009), many of which are found within the proposed project area.

The study identified the following areas as sensitive from an avifaunal perspective:

- Important Bird Areas and potential nesting sites for SCC (with buffers);
- Process areas such as perennial rivers, pristine wetlands and wetland clusters identified by NFEPA that are important for water bird guilds;
- Formal Protected Areas and Critical Biodiversity Areas; and
- Habitats which are likely to provide refuge for avifaunal SCC based on field surveys and the desktop analysis.

Avifaunal sensitivity map of the project area

The impacts on avifauna likely to be caused by the construction and operation of the proposed powerline and substation construction (and associated infrastructure) are summarised below.

Gourikwa – Blanco Alternative 1 (Preferred Alternative)

Impact	Without mitigation	With mitigation
Construction Phase		
1. Loss of Bird Habitat	40 (Medium)	30 (Medium)
2. Disturbance and Displacement	32 (Medium)	15 (Low)
3. Loss of Bird Diversity and SCC	21 (Low)	14 (Low)
Operation Phase		
1. Loss of Bird Habitat	18 (Low)	18 (Low)
2. Disturbance and Displacement	27 (Low)	27 (Low)
3. Loss of Bird Diversity and SCC	70 (High)	55 (Medium)

Gourikwa – Blanco Alternatives 2, 3 & 4

Impact	Without mitigation	With mitigation
Construction Phase		
1. Loss of Bird Habitat	35 (Medium)	30 (Medium)
2. Disturbance and Displacement	24 (Low)	15 (Low)
3. Loss of Bird Diversity and SCC	21 (Low)	14 (Low)
Operation Phase		
1. Loss of Bird Habitat	18 (Low)	18 (Low)
2. Disturbance and Displacement	27 (Low)	27 (Low)
3. Loss of Bird Diversity and SCC	60 (Medium/High)	44 (Medium)

Recommendations

Alternative 2 is the preferred alternative from an avifaunal perspective. There are existing powerline infrastructures which mitigates many of the impacts associated with birds and powerlines. The existing service roads will result in less bird habitat being destroyed or fragmented during the construction phase of the project. Alternative 1 (preferred) is likely to have the greatest overall impact on avifauna of all of the route options due to its proximity to the Outeniqua IBA. Should alternative 1 be chosen, it is recommended that bird diverters are installed on all powerline infrastructure between Gondwana Private Game Reserve and the chosen Narina Substation as it is anticipated that numerous bird SCC will utilise these areas for hunting/foraging. Where access roads and/or pylon bases do need to be located within any of the identified sensitive areas then there should be further ground-truthing by an avifaunal specialist to determine exact road routes and pylon base locations so to, where possible, avoid site specific sensitive areas such as nests and roosts. All bird nest/roost sites encountered should be considered “No-Go” areas for any pylon hardstands or the construction of access roads. The power line should be constructed in close proximity to the existing power line as many birds will be aware of the existing infrastructure which may reduce collisions in low visibility conditions. All areas defined as having a medium avifaunal sensitivity must have bird diverters installed (spacing to be determined following ground-truthing). These areas include suitable habitat for numerous powerline priority species (e.g. cranes, bustards, and storks).

Substations

Impact	Without mitigation	With mitigation
Construction Phase		
1. Substations 1, 2, & 3	35 (Medium)	15 (Low)
2. Substation 4	45 (Medium)	21 (Low)
3. Substation 5	45 (Medium)	21 (Low)
Operation Phase		
1. Substation 1, 2, & 3	44 (Medium)	24 (Low)
2. Substation 4	44 (Medium)	24 (Low)
3. Substation 5	52 (Medium)	30 (Medium)

Substation 2 is the recommended option from an avifaunal perspective as there is; i) an existing substation, ii) the surrounding habitat is highly transformed, iii) and the area is classified as having a ‘low’ avifaunal sensitivity.

1. INTRODUCTION

1.1 Project description and locality

EOH Coastal & Environmental Services has been contracted by Envirolution Consulting to conduct a specialist avifaunal study for the Gourikwa-Blanco 400kV Powerline and Substations upgrade. The study comprised of both a desktop study and a detailed field survey to investigate the potential impact of the proposed powerline and substation upgrades on the avifaunal communities and species in the area.

The project entails the construction of a 400 kV power line from the Gourikwa Substation at Mossel Bay to the Blanco Substation at George for which there are three alternative routes which need to be assessed (Figure 1-1). Alternative 1 runs for 57km from the Gourikwa substation in a north-east direction following the Proteus-Droerivier 400Kv line to the proposed Narina Transmission Substation. Alternative 2 runs parallel to an existing line south of the first option (Alternative 1). The third option, Alternative 3, is an alternative to Alternative 2 and initially runs east to Hartenboss along an existing line and then joins Alternative 2 on the north side of the Brandwag River (Figure 1-1).

Following further assessment, a fourth option, Alternative 4 (Figure 1-2), was proposed which utilises sections of each of the other three options whereby it follows the route of Alternative 3 to the point where it joins Alternative 2 and follows this route before turning north to join Alternative 1 approximately 20km from the substation at Blanco.

Five alternative positions for the Narina Transmission Substation have been proposed. Alternative 2 is at an existing substation and as such this will be upgraded to accommodate the proposed powerlines. Alternatives 1, 3, 4 and 5 will require the construction of a transmission station and the impacts associated with this will therefore be greater.

The corridor to be investigated along each of the proposed power lines is 1 km wide. However, the final servitude of the power line will only be 62 m. The desktop investigation focused on a larger area to incorporate potential alignment changes following specialist recommendations during the scoping phase of the EIA. Following desktop findings, site investigations for the study area were confined to and concentrated on the areas defined as “sensitive” during the scoping exercise.

1.2 Objectives and Terms of Reference

The principal objective of this assignment was to carry out an avifaunal baseline study that assessed environmental/biodiversity impacts associated with the Project and identified specific mitigation measures and actions necessary for the Project to comply with all relevant national and local environmental laws and regulations.

The scope of work of the avifaunal baseline study included the following tasks:

Task 1 – Desktop Survey

A thorough desktop survey was completed by CES in 2015. This included an initial review of all existing relevant documents and information in relation to avifauna and habitats, (e.g. previous desktop studies or other specialist reports, environmental impact assessment reports, environmental licenses, etc.).

Initial studies used the following databases and spatial planning tools to identify and select sensitive areas which should be assessed during the field survey:

- South African Bird Atlassing Project (SABAP2)
- BirdLife South Africa Important Bird Areas (IBAs)
- Endangered Wildlife Trust Collision/Electrocution Databases

- Western Cape Biodiversity Sector Plan (WCBSP 2017)
- SANBI vegetation map (Mucina and Rutherford, 2012)
- National Freshwater Ecosystem Priority Areas (NFEPA)
- South African Red Data List
- IUCN Red List
- NEM:BA species list (Act 10 of 2004)
- Provincial Nature Conservation Ordinance Act (PNCO) – No.19 of 1974.

Areas chosen for ground-truthing were based on the levels of biodiversity, the presence of avifaunal Species of Conservation Concern (SCC), endemic and protected species within the proposed route alternatives, habitat associations of avifaunal SCC, and the presence of conservation areas and habitats where disturbance should be avoided or minimized based on municipal and national protection plans.

Task 2 – Sampling and collection of primary data during field visits

The faunal specialists collected relevant field data on the avifauna in the Project area from the 22nd-27th of July 2016.

The following objectives have been defined for the avifaunal specialist study:

- To provide a general description of the avifauna of the project area and adjacent areas;
- To review the avifauna likely to occur in the project area for the presence of Species of Conservation Concern (SCC);
- To assess the habitat associations of the avifaunal components, and;
- To provide guidance on the alternative routes based on the resident avifauna and their associated habitats.

Task 3 – Reporting

A Report detailing the results of data collection, impact and risk assessment and suggested mitigation measures needed to address those impacts. If necessary, the powerline route should be revised to incorporate appropriate mitigation measures.

A Faunal Specialist Report (this report) was produced and includes the following;

- The identification and assessment of the significance of potential impacts on avifauna resulting from the proposed development both on the footprint and the immediate surrounding area (1km buffer) during construction and operation;
- A detailed description of appropriate mitigation measures that can be adopted to reduce negative impacts for each phase of the project, where required;
- Identification of any *No-Go* areas;
- An updated sensitivity map based on the findings of the survey; and
- Checklists of birds identified in the region to date, highlighting sensitive species and their possible areas of distribution within the spatial scope of the study.

1.3 Assumptions and Limitations

This report is based on currently available information and, as a result, the following limitations and assumptions are implicit:

- The report is based on a project description taken from design specifications for the proposed power line that have not yet been finalised, and which are likely to undergo a number of iterations and refinements before they can be regarded as definitive;
- Descriptions of the avifauna are based on available literature and databases;
- Only birds have been described in this report;

- Avifaunal fieldwork consisted of six (6) days of surveying during winter;
- The seasonal timing of the survey is not ideal as many summer migrant bird species are not likely to be found on site during the survey period. However, the fieldwork in conjunction with the desktop survey was sufficient to identify and rate impacts.
- Field surveying concentrated on the areas identified as “sensitive” from the desktop study.

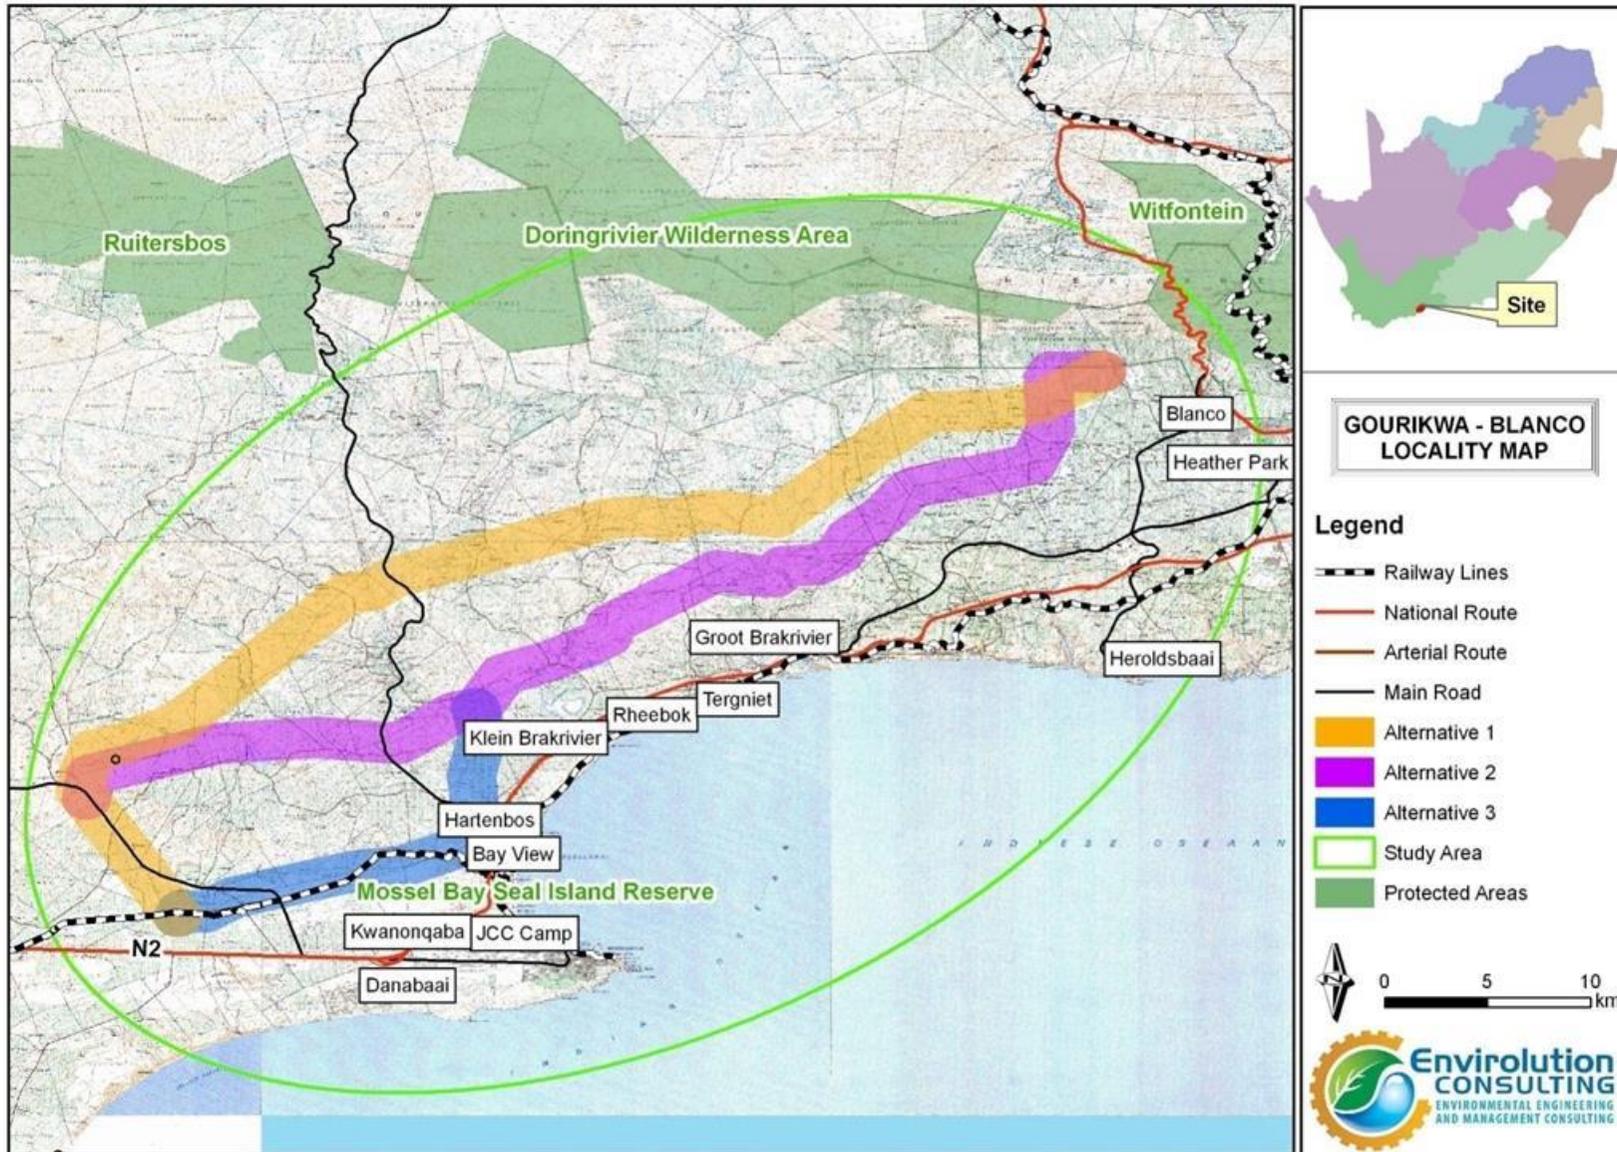

Figure 1-1: Map of the three proposed 400kV power line alternatives and study area from the Gourikwa to Blanco substations

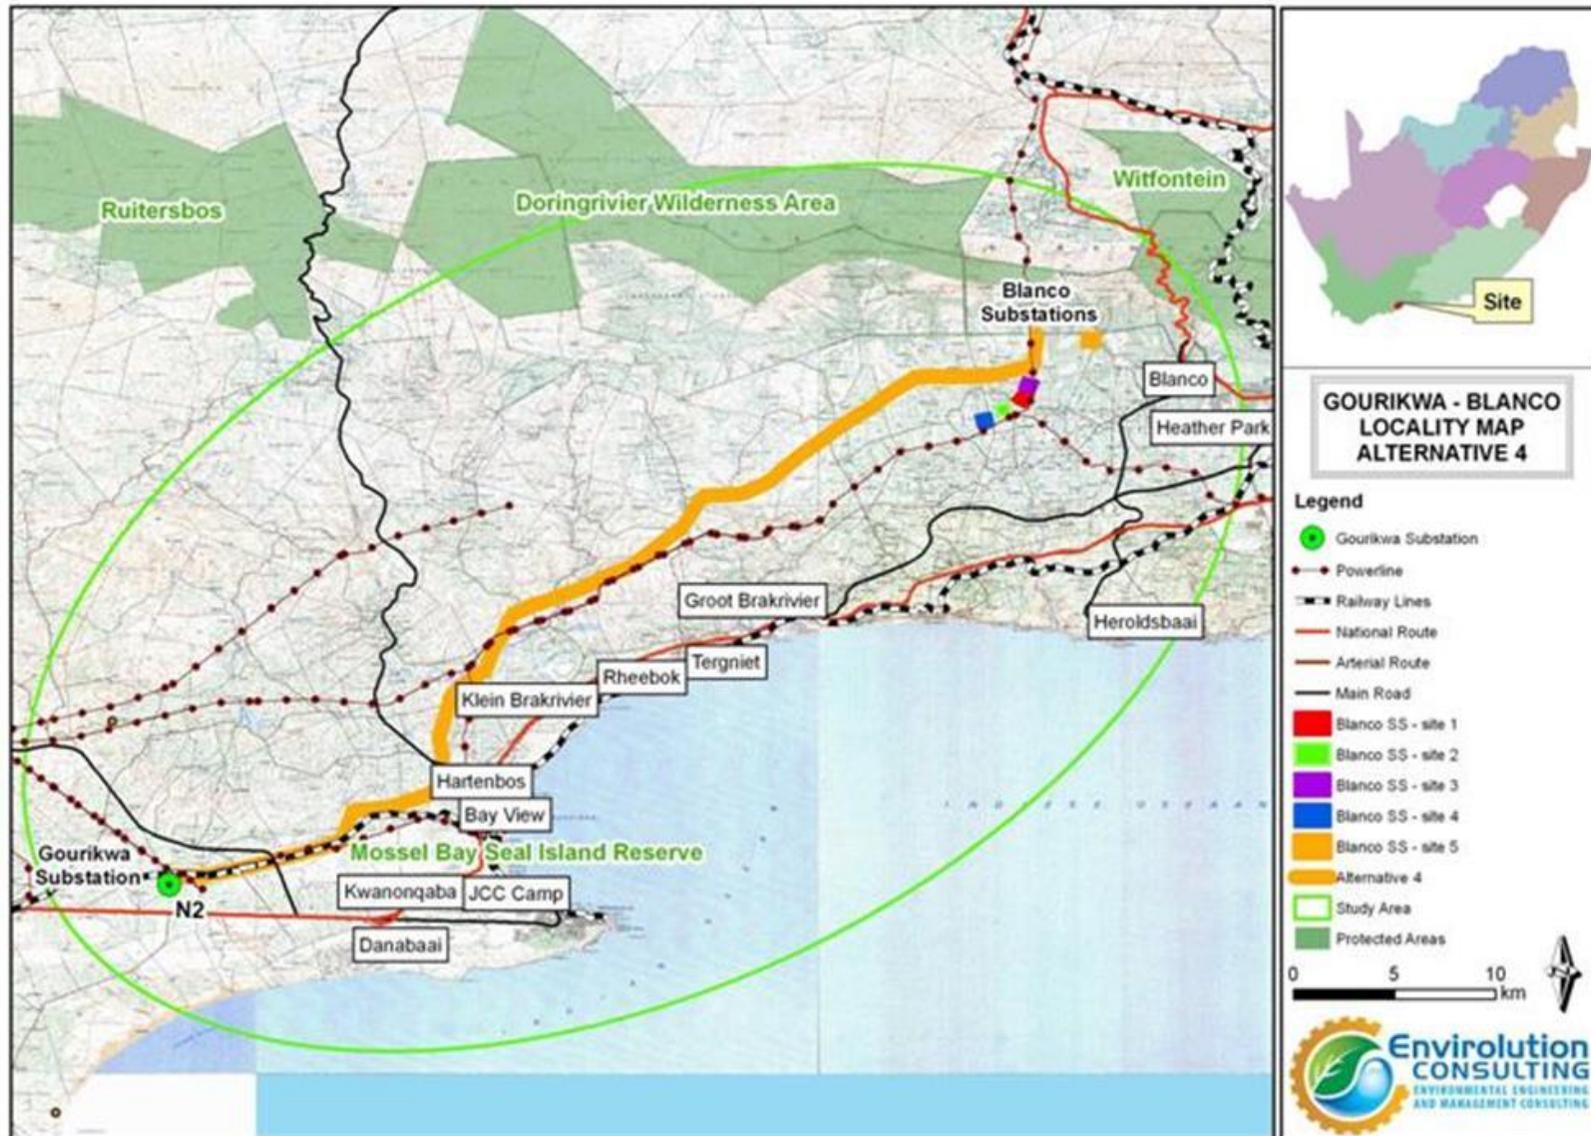

Figure 1-2: Map of the three proposed 400kV power line alternatives and study area from the Gourikwa to Blanco substations

2. APPROACH

To give insight into the faunal components of the project area, the desktop faunal assessment used relevant databases and spatial planning tools to identify protected areas and areas of special concern within the greater project area. These included:

- South African Bird Atlassing Project (SABAP2)
- BirdLife South Africa Important Bird Areas (IBAs)
- Endangered Wildlife Trust Collision/Electrocution Databases
- Western Cape Biodiversity Sector Plan (WCBSP 2017)
- SANBI vegetation (Mucina and Rutherford, 2012)
- National Freshwater Ecosystem Priority Areas (NFEPAs)
- SA Red Data List
- IUCN Red List
- NEM:BA species list (Act 10 of 2004)
- Provincial Nature Conservation Ordinance Act (PNCO) – No. 19 of 1974.

2.1.1 Protected Areas

Protected and conserved areas are likely to provide habitat refuge for a great diversity and richness of faunal species, as well as maintain ecological functioning. Therefore, these areas have been identified as areas of concern from a faunal perspective. In addition, ecological corridors that support faunal movements have been identified.

Protected Areas within the project area were identified using the National Biodiversity Assessment (NBA) 2011, which is based on the ecosystem protection level which is critical to identify current levels of protection of habitats and biodiversity. The NBA (2011) works in correlation with the National Protect Areas Expansion Strategy (NPAES) to help identify where future conservation efforts should be focused.

2.1.2 Critical Biodiversity Areas

Critical Biodiversity Areas (CBAs) are areas which play an important role for the protection and sustainability of biodiversity, which includes important locations for biodiversity features or rare species (Holness and Bradshaw, 2012). Municipal CBA maps which form part of the Western Cape Biodiversity Sector Plan (WCBSP 2017) were consulted.

CBAs offer guidance to achieve the desired land-use management objectives, highlighting areas which need to be i) maintained, ii) rehabilitated, or iii) managed to prevent further degradation, in order to achieve desired ecological functioning. Functioning ecological systems provide the necessary ecological integrity required to provide habitats which offer protection and refuge for many faunal species.

2.1.3 Wetlands and Rivers

The National Freshwater Ecosystem Priority Areas (NFEPAs) spatial planning tool was used to identify wetlands and rivers within the project area. It was assumed that these would be areas associated with water birds. The identification of perennial rivers and healthy wetlands aids in identifying potential preferred habitats and sensitive areas.

2.1.4 Avifaunal Species of the Project Area

A literature review was conducted to establish a list of the avifauna which may occur within the project area. Species known from the region, or from adjacent regions whose preferred habitat(s) were known to occur within the study area, were also included. Literature and spatial planning tool sources consulted included:

- South African Bird Atlassing Project (SABAP2), BirdLife South Africa Databases, The 2015 Eskom Red Data Book of Birds of South Africa, Lesotho and Swaziland, as well as information supplied by the Endangered Wildlife Trust.

2.1.5 Species of Conservation Concern

Species that are afforded special protection, notably those that are protected by NEMA. Endangered and Protected Fauna in the 1974 Provincial Nature Conservation Ordinance (PNCO), South African Red List of South African (SA Red Data List), and the IUCN Red List.

Species of Conservation Concern (SCC) in terms of the project area are defined as:

- **Threatened species:**

Species listed as threatened in the revised South African Red Data Books; and/or

- Species included in other international lists (e.g., 2015 IUCN Red List of Threatened Animals). Definitions include:
 - *Critically Endangered* (CR) - A taxon is Critically Endangered when the best available evidence indicates that it meets any of the criteria A to E for Critically Endangered (see Section V), and it is therefore considered to be facing an extremely high risk of extinction in the wild.
 - *Endangered* (EN) - A taxon is Endangered when the best available evidence indicates that it meets any of the criteria A to E for Endangered (see Section V), and it is therefore considered to be facing a very high risk of extinction in the wild.
 - *Vulnerable* (VU) - A taxon is Vulnerable when the best available evidence indicates that it meets any of the criteria A to E for Vulnerable, and it is therefore considered to be facing a high risk of extinction in the wild.
 - *Near Threatened* (NT) - A taxon is Near Threatened when it has been evaluated against the criteria but does not qualify for Critically Endangered, Endangered or Vulnerable now, but is close to qualifying for or is likely to qualify for a threatened category in the near future.
- **Sensitive species:** Species not falling in the categories above but listed in: Appendix 1 or 2 of the Convention of International Trade in Endangered Species (CITES).
- **Endemic species:** Species endemic to the Western Cape and/or South Africa.

2.1.6 Field survey

A field survey was carried out by the specialists from the 22nd to the 27th of July 2017. Transects were driven or walked during daylight hours to record all bird species encountered during the survey. Habitats pre-defined as having a high avifaunal sensitivity or known to harbour species of conservation concern were mapped prior to the field trip. These areas were all actively surveyed with the aim of ground-truthing habitats in order to make accurate species composition associations. Apart from the pre-defined sensitive areas, the field survey was conducted using an opportunistic approach to list avifaunal species encountered along the proposed route options.

Areas and habitats surveyed include:

- Gourikwa substation;
- Gondwana Private Game Reserve;
- Hartenbos Game Reserve;
- Hartebeeskuil Dam;
- Klipheuwel Wetland System;
- Wolwedans Dam;
- Grootbrakrivier to Molen Drift Agricultural lands;
- Proposed Narina substation sites; and
- South Facing slopes of the Outeniqua Mountain Range.

Please see sensitivity map (Figure 8-1) for numbers associated to field photographs (Table 8-1) captured during the survey.

3. PROTECTED AREAS

The National Biodiversity Assessment (2011) identifies Protected Areas based on the ecosystem protection level which is critical to identify current levels of protection of habitats and biodiversity. The NBA (2011) categorizes protected areas into Formal A and Formal B categories, depending on their level of protection.

The NBA (2011) works in correlation with the National Protected Areas Expansion Strategy (NPAES) to help identify where future conservation efforts should be focused. South Africa's protected area network currently falls short of sustaining biodiversity and ecological processes. In this context, the goal of the NPAES is to achieve cost effective protected area expansion for ecological sustainability and adaptation to climate change (BGIS, 2007).

The NPAES sets targets for protected area expansion, provides maps of the most important areas for expansion, and makes recommendations on mechanisms these areas. It deals with land-based and marine protected areas across all of South Africa's territory. Focus areas for land-based protected area expansions are large, intact and unfragmented areas of high importance for biodiversity representation and ecological persistence. These areas are suitable for the creation or expansion of large protected areas (BGIS, 2007).

The focus areas were identified through a systematic biodiversity planning process undertaken as part of the development of the National Protected Area Expansion Strategy 2008 (NPAES). They present the best opportunities for meeting the ecosystem-specific protected area targets set in the NPAES (BGIS, 2007).

Figure 3-1 illustrates the Formal Protected and NPAES Areas within the greater project area. None of the four alternatives for the Gourikwa-Blanco power line cross/influence any NPAES or protected areas. However, the Doringrivier Wilderness Area and the Ruitersbos Nature Reserve run parallel to all four proposed alternative routes along the Outeniqua Mountains and are approximately 5 to 10 kilometres from the routes.

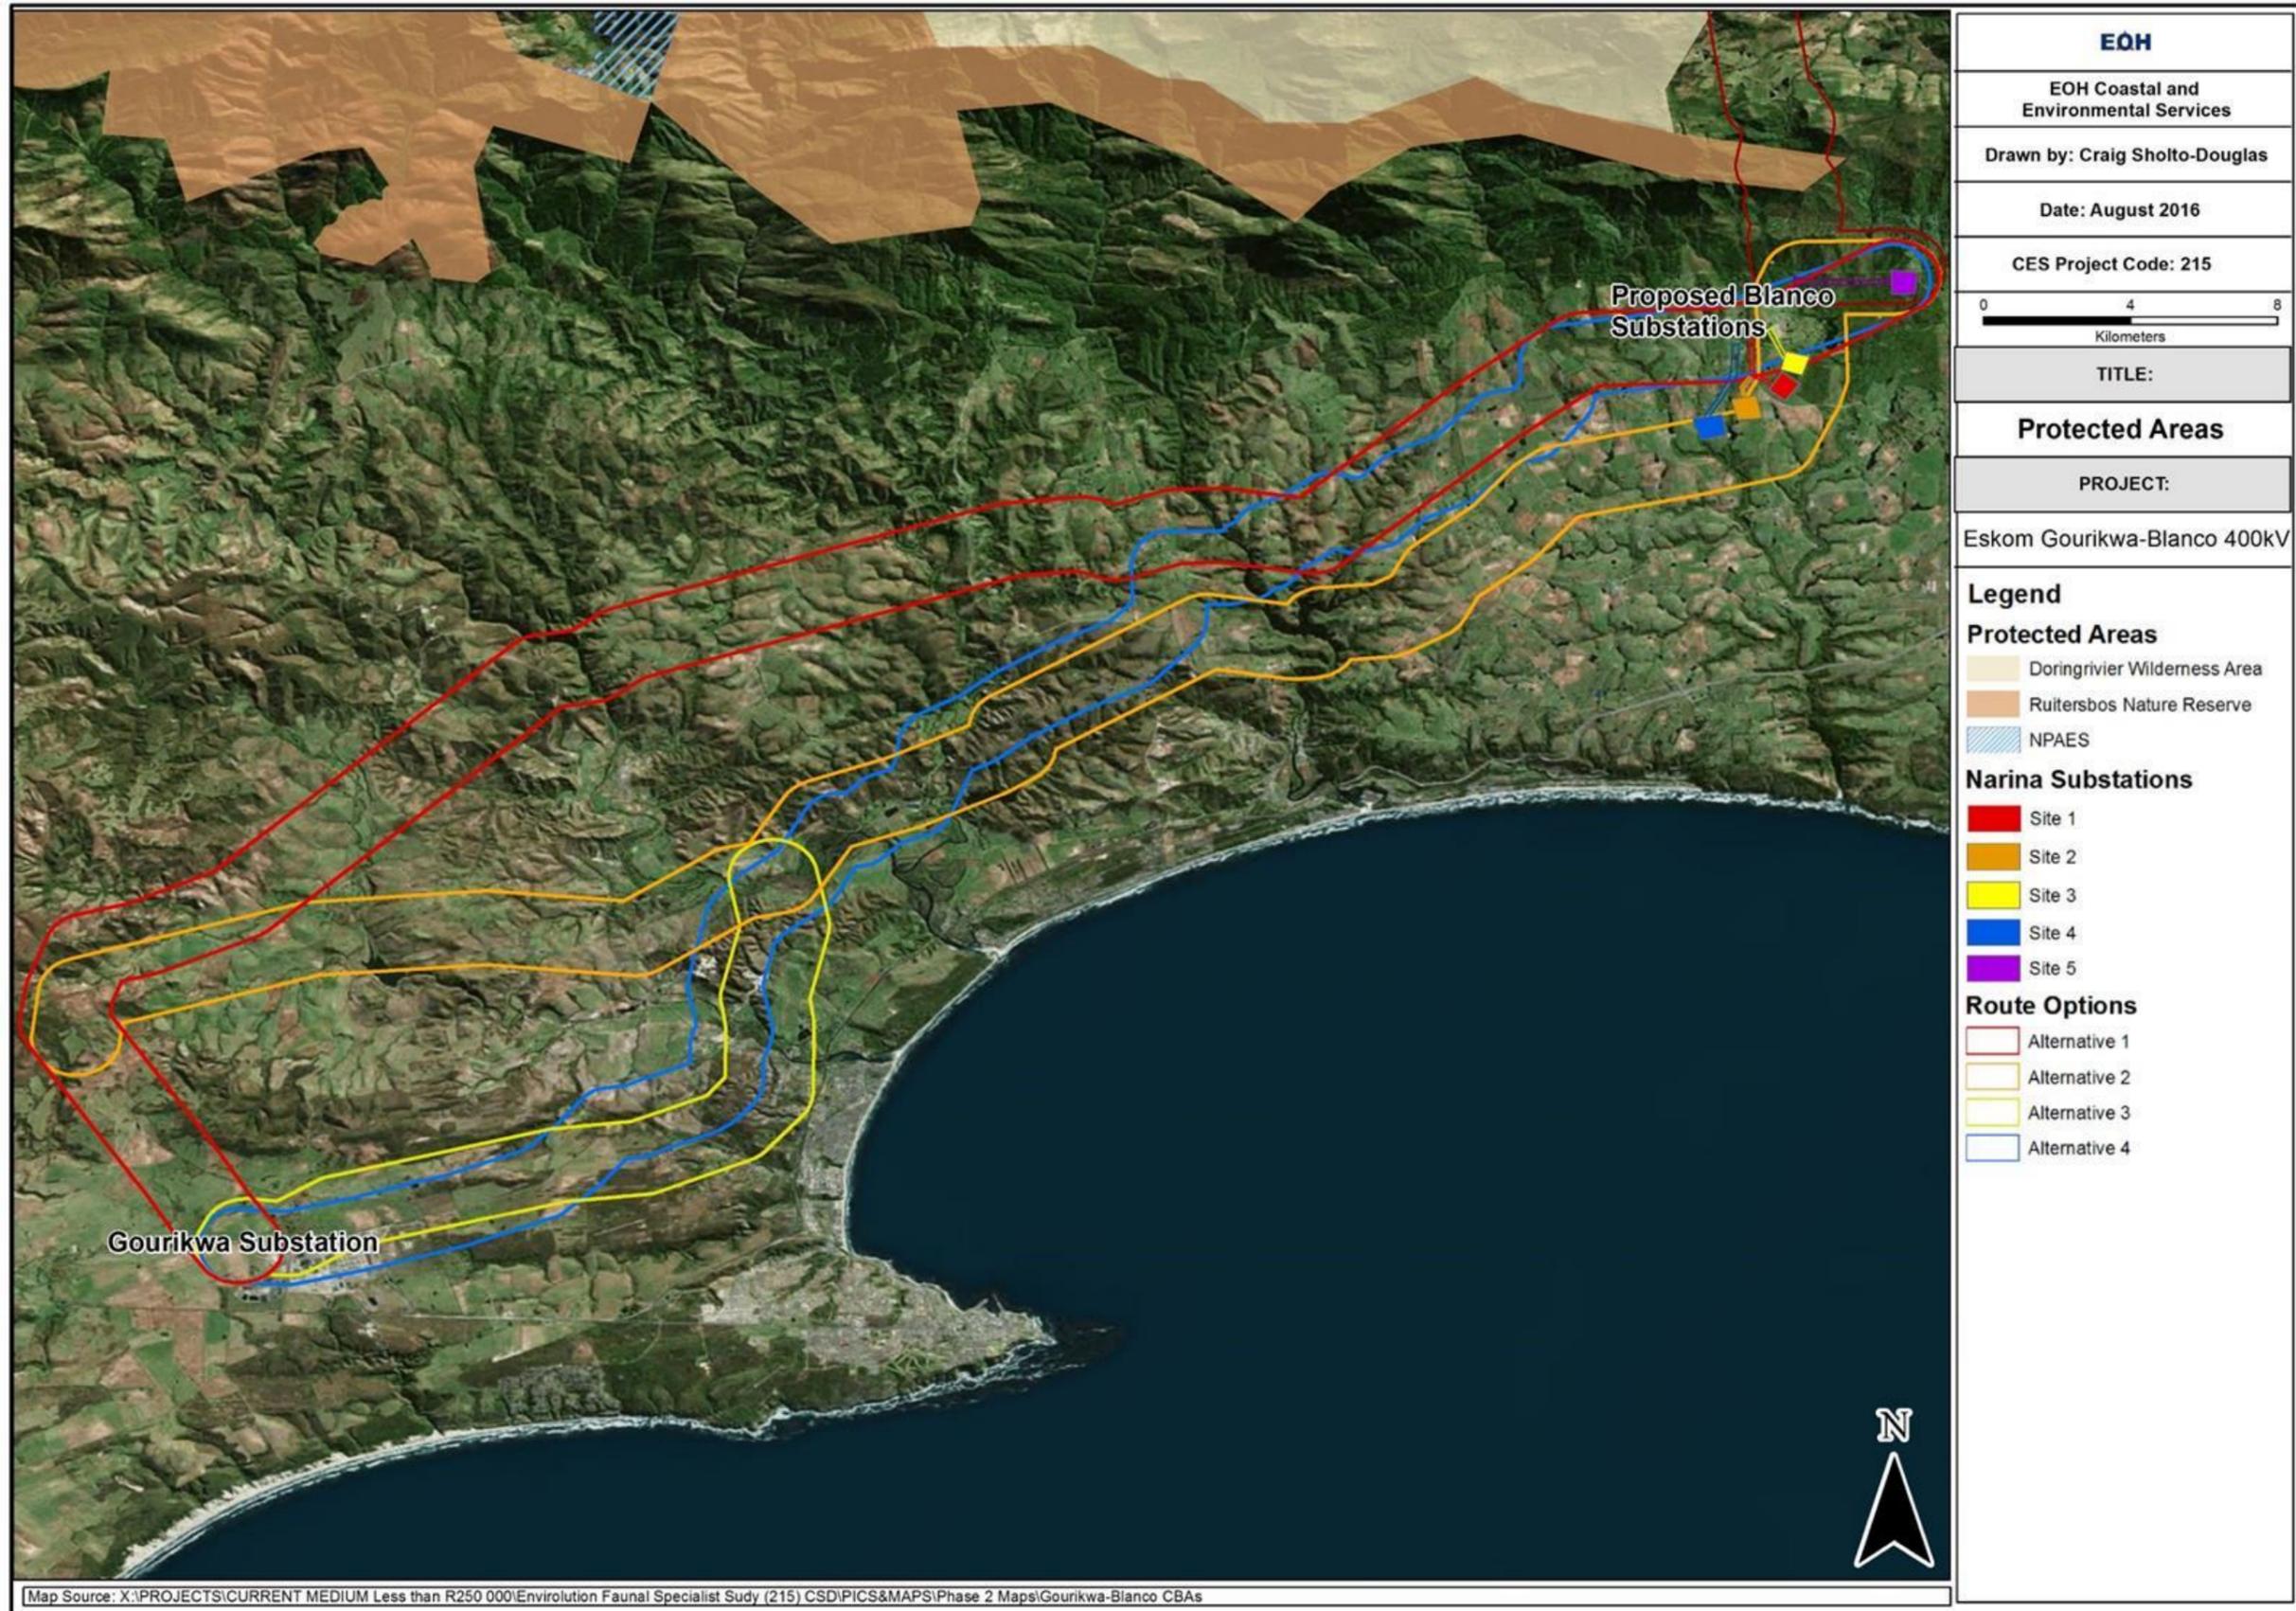

Figure 3-1: Formal Protected and NPAES Areas within the project area

4. CRITICAL BIODIVERSITY AREAS (CBAS)

CBAs incorporate (i) areas that need to be safeguarded in order to meet national biodiversity thresholds; (ii) areas required to ensure the continued existence and functioning of species and ecosystems, including the delivery of ecosystem services; and/or (iii) important locations for biodiversity features or rare species (Holnes and Bradshaw, 2010).

Although CBAs are defined using a vast range of ecological factors, faunal species rarity, richness and diversity form key criteria. Furthermore, CBAs aim to maintain or improve the condition of landscapes, which contributes to improved ecological function, enhancing the habitat provision which will sustainably accommodate a rich and diverse faunal component. Ecological Support Areas (ESAs) are supporting zones required to prevent the degradation of Critical Biodiversity Areas and Protected Areas. These may include areas that are degraded or even transformed, if these areas still play an important role in supporting CBAs (Holnes and Bradshaw, 2010).

CBAs are mapped at varying spatial scales (e.g. municipality, district or provincial) depending on the region. Data extracted from the SANBI Biodiversity GIS database (WCBSP, 2017) were used to create a map illustrating the CBAs, Protected Areas and Ecological Support Areas of the proposed project area (Figure 4-1). The following CBA maps were used;

- **George** [Vector] 2017.
- **Knysna** [Vector] 2017.
- **Mossel Bay** [Vector] 2017.

The above mentioned Biodiversity Frameworks and CBAs integrate key biodiversity information relevant to land-use. This was used to determine the location of critical biodiversity areas within the project area (Figure 4-1). A description of the desired management objectives are presented in Table 4-1.

Table 4-1: CBA Map Categories

CBA Map Category	Desired Management Objective	Suggested Land Use
Protected Area Critical Biodiversity Areas (CBA)	Maintain Natural Land. Rehabilitate degraded to natural or near natural. Manage for no further degradation.	Conservation
Ecological Support Area (ESAs)	Maintain ecological processes.	Conservation Game farming Communal livestock
No Natural Areas	Sustainable development and management within general rural land-use principles. Favoured areas for development.	Commercial livestock Dry land cropping Irrigated cropping Dairy farming Timber Settlement

As can be seen in Figure 4-1, all of the proposed alternatives cross through many CBAs and ESAs within the project area. All four proposed alternative routes from the Gourikwa to Blanco substation cross numerous CBAs and ESAs.

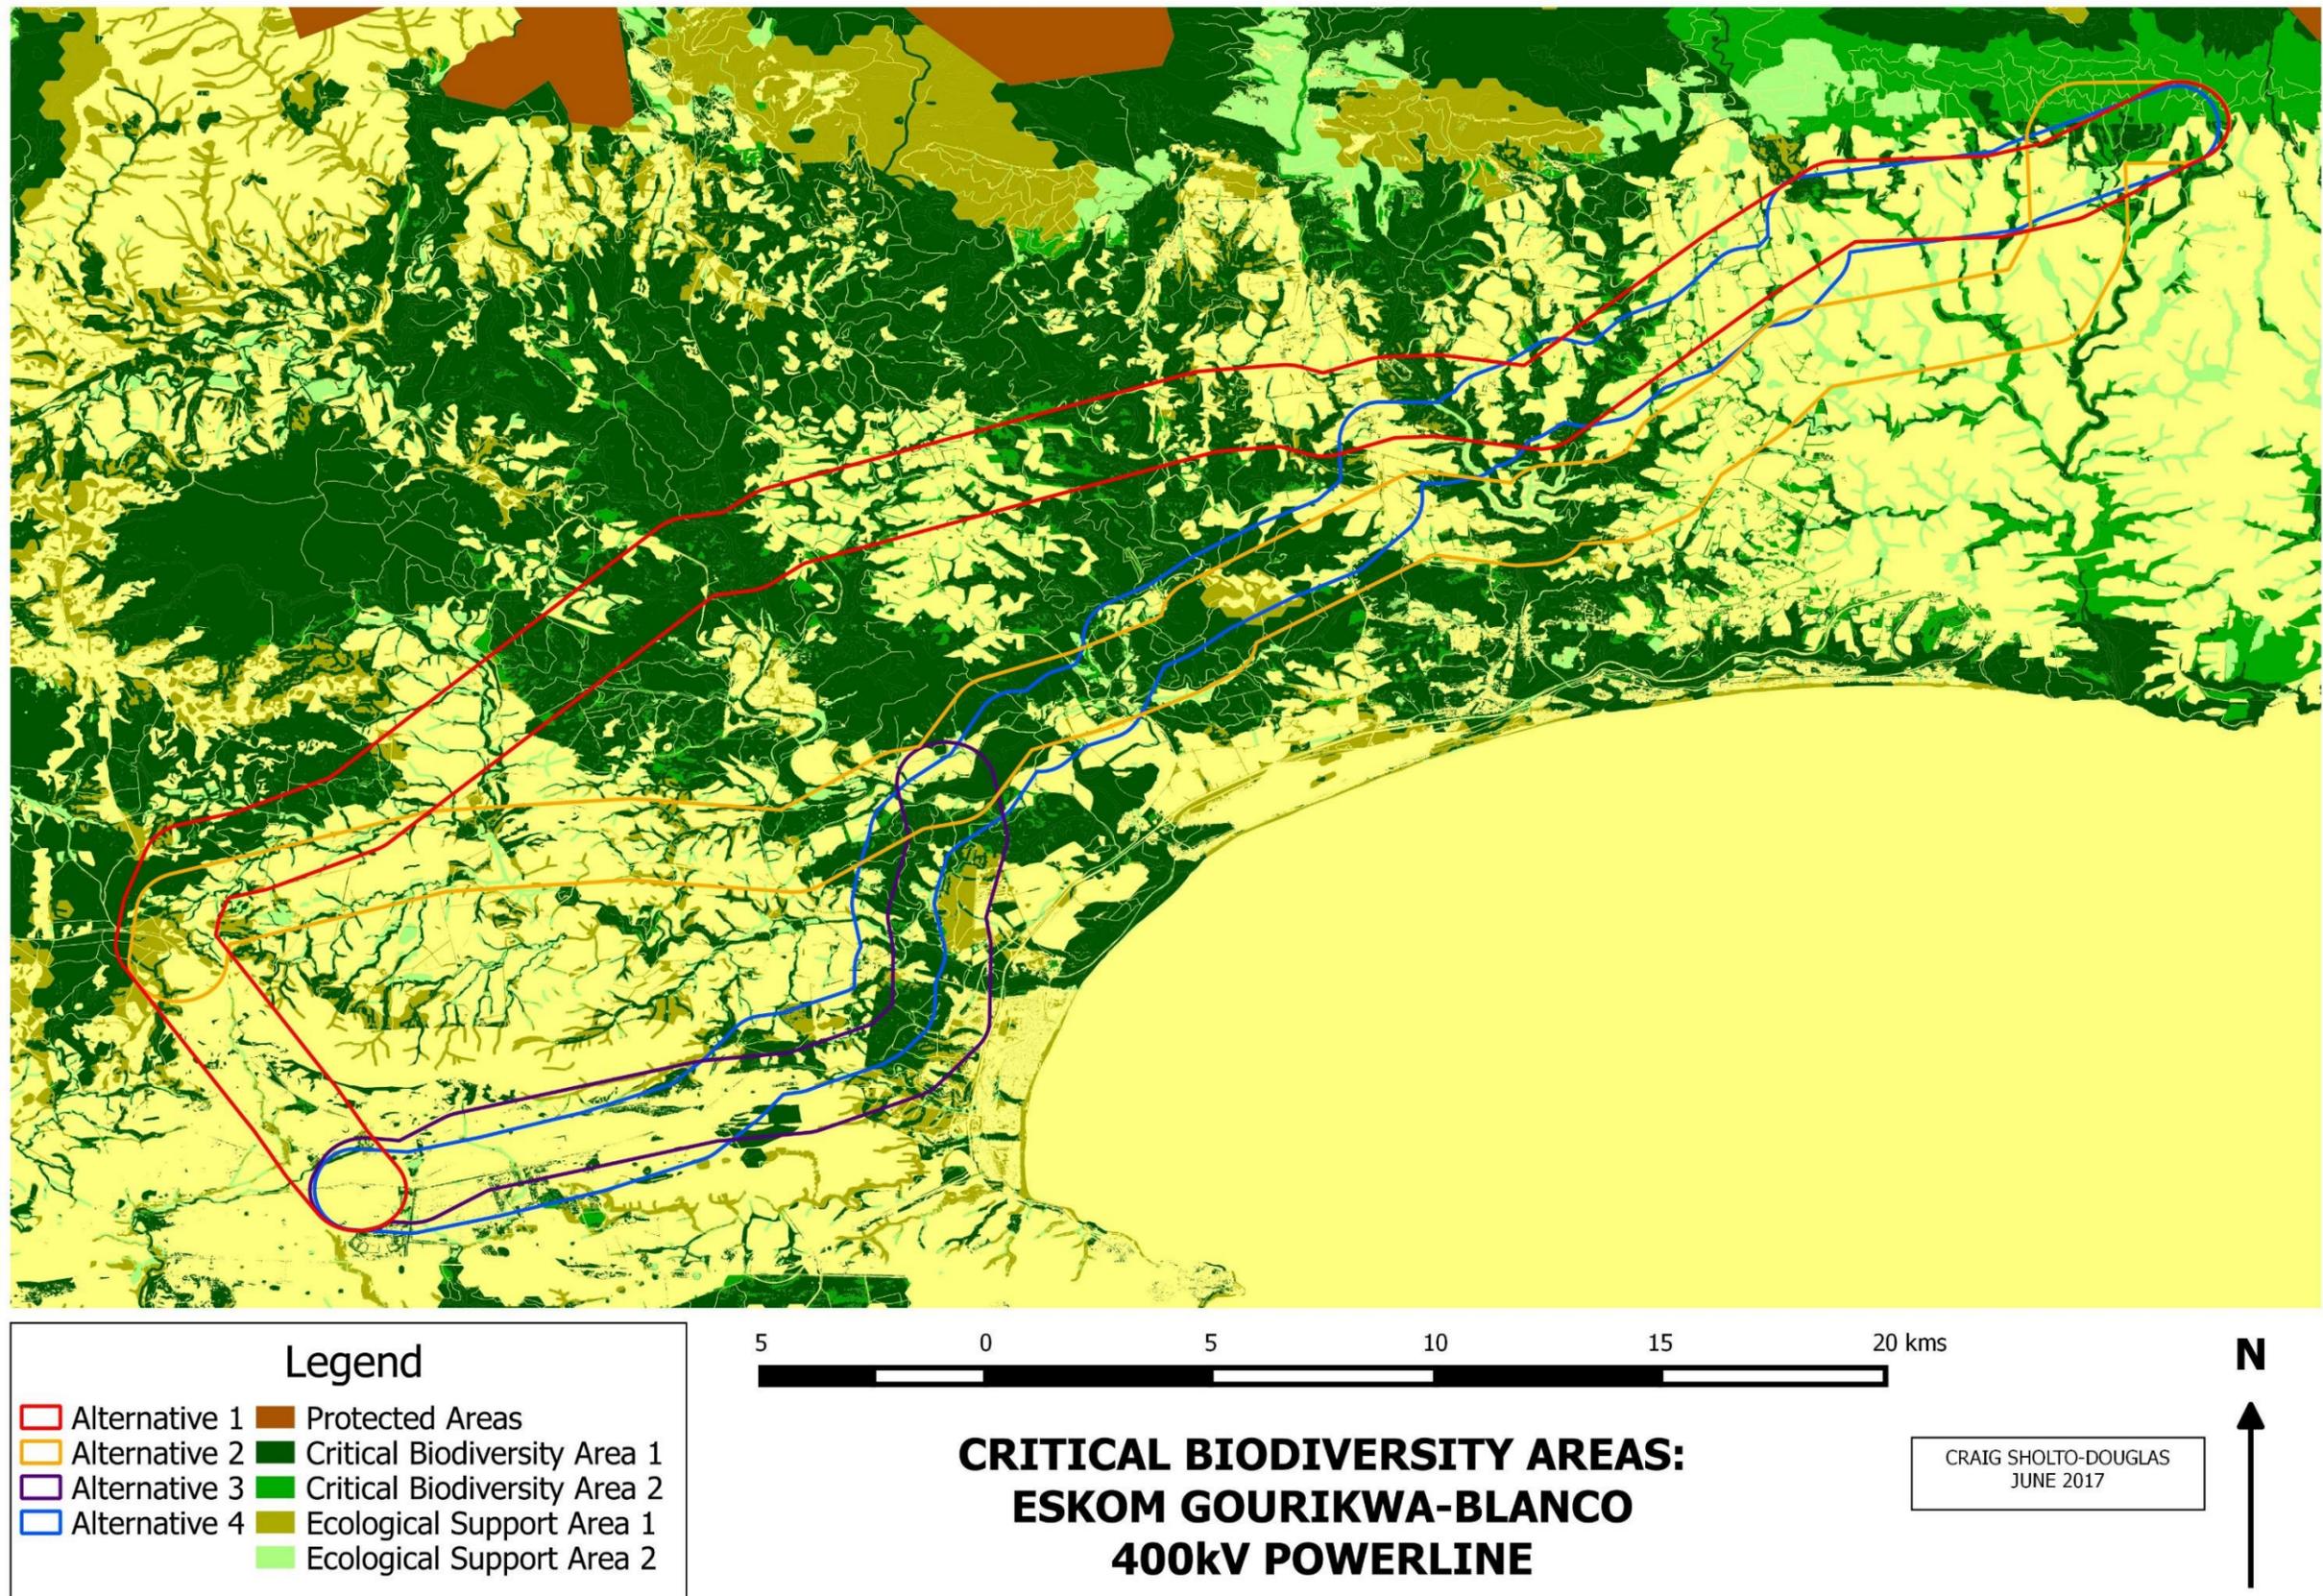

Figure 4-1: Critical Biodiversity Areas within the project area

5. WETLANDS AND RIVERS

The NFEPA project aims to identify a national network of freshwater conservation areas and to explore institutional mechanisms for their implementation. Freshwater Ecosystem Priority Areas (FEPAs) are strategic spatial priorities for conserving freshwater ecosystems and supporting sustainable use of water resources. FEPAs are often tributaries and wetlands that support hard-working large rivers, and are an essential part of an equitable and sustainable water resource strategy. FEPAs need to stay in a good condition to manage and conserve freshwater ecosystems, and to protect water resources for human use. This does not mean that FEPAs need to be fenced off from human use, but rather that they should be supported by good planning, decision-making and management to ensure that human use does not impact on the condition of the ecosystem.

Since terrestrial waterbirds are generally associated with wetlands and rivers, the NFEPA spatial planning tool was used to identify wetlands and rivers within the project area and in so doing this to identify potential sensitive areas for amphibians and waterbirds.

Wetland conditions classified as AB and C are generally considered to be in a natural or good condition, or only slightly modified. These wetlands are likely to provide suitable habitat for a high diversity and richness of amphibian and bird species.

Wetland clusters are groups of wetlands embedded in a relatively natural landscape. In many areas of the country, wetland clusters no longer exist because the surrounding land has become too fragmented by human impacts. However, two regions within the project area (Figure 5-1 inserts) have significant groupings of wetland clusters and should be considered sensitive areas for waterbirds.

Wetland conditions classified as DEF, Z1, Z2, or Z3 are generally considered to be heavily to critically modified, and are therefore considered to be less sensitive from a waterbird perspective.

Table 5-1 comments on the likelihood of each alternative affecting the various wetlands and rivers.

Table 5-1: Likely effects of the alternative powerline routes on wetlands and rivers

Route	Comment
G-B Alternative 1	This alternative crosses many rivers, wetlands, and wetlands clusters identified by NFEPA. Of the three Gourikwa-Blanco alternatives, this one crosses the most perennial rivers due to its proximity to the escarpment. However, these rivers are likely to be fast flowing and less habitable for waterbird species than the lower reaches of the rivers, which would be crossed by the other alternative routes. Alternative 1 will also cross the most natural/pristine wetlands of the alternative routes.
G-B Alternative 2	Alternative 2 will transect more areas identified as wetland clusters than alternative 1. This route will also cross many perennial rivers. Generally, the wetlands classified outside of wetland clusters are in a less natural condition than the other 2 alternatives. However, the Klipheuwel/Grootbrak Wetland System (numbered 5 on the sensitivity map) is a large wetland system which plays a vital role in the functioning of the Grootbrakrivier River System. This system should be avoided.
G-B Alternative 3	This alternative crosses one NFEPA identified wetland clusters and one perennial river. Many of the wetlands in this area are considered degraded. It is more likely that this alternative can avoid pristine wetlands and perennial rivers than the other three alternatives.
G-B Alternative 4	This alternative crosses many rivers, wetlands, and wetlands clusters identified by NFEPA. Towards the end of this route it crosses perennial rivers due to its proximity to the escarpment. However, these rivers are likely to be fast flowing and less habitable for waterbird species although it does cross the lower reaches of the rivers when it follows Alternative 1.

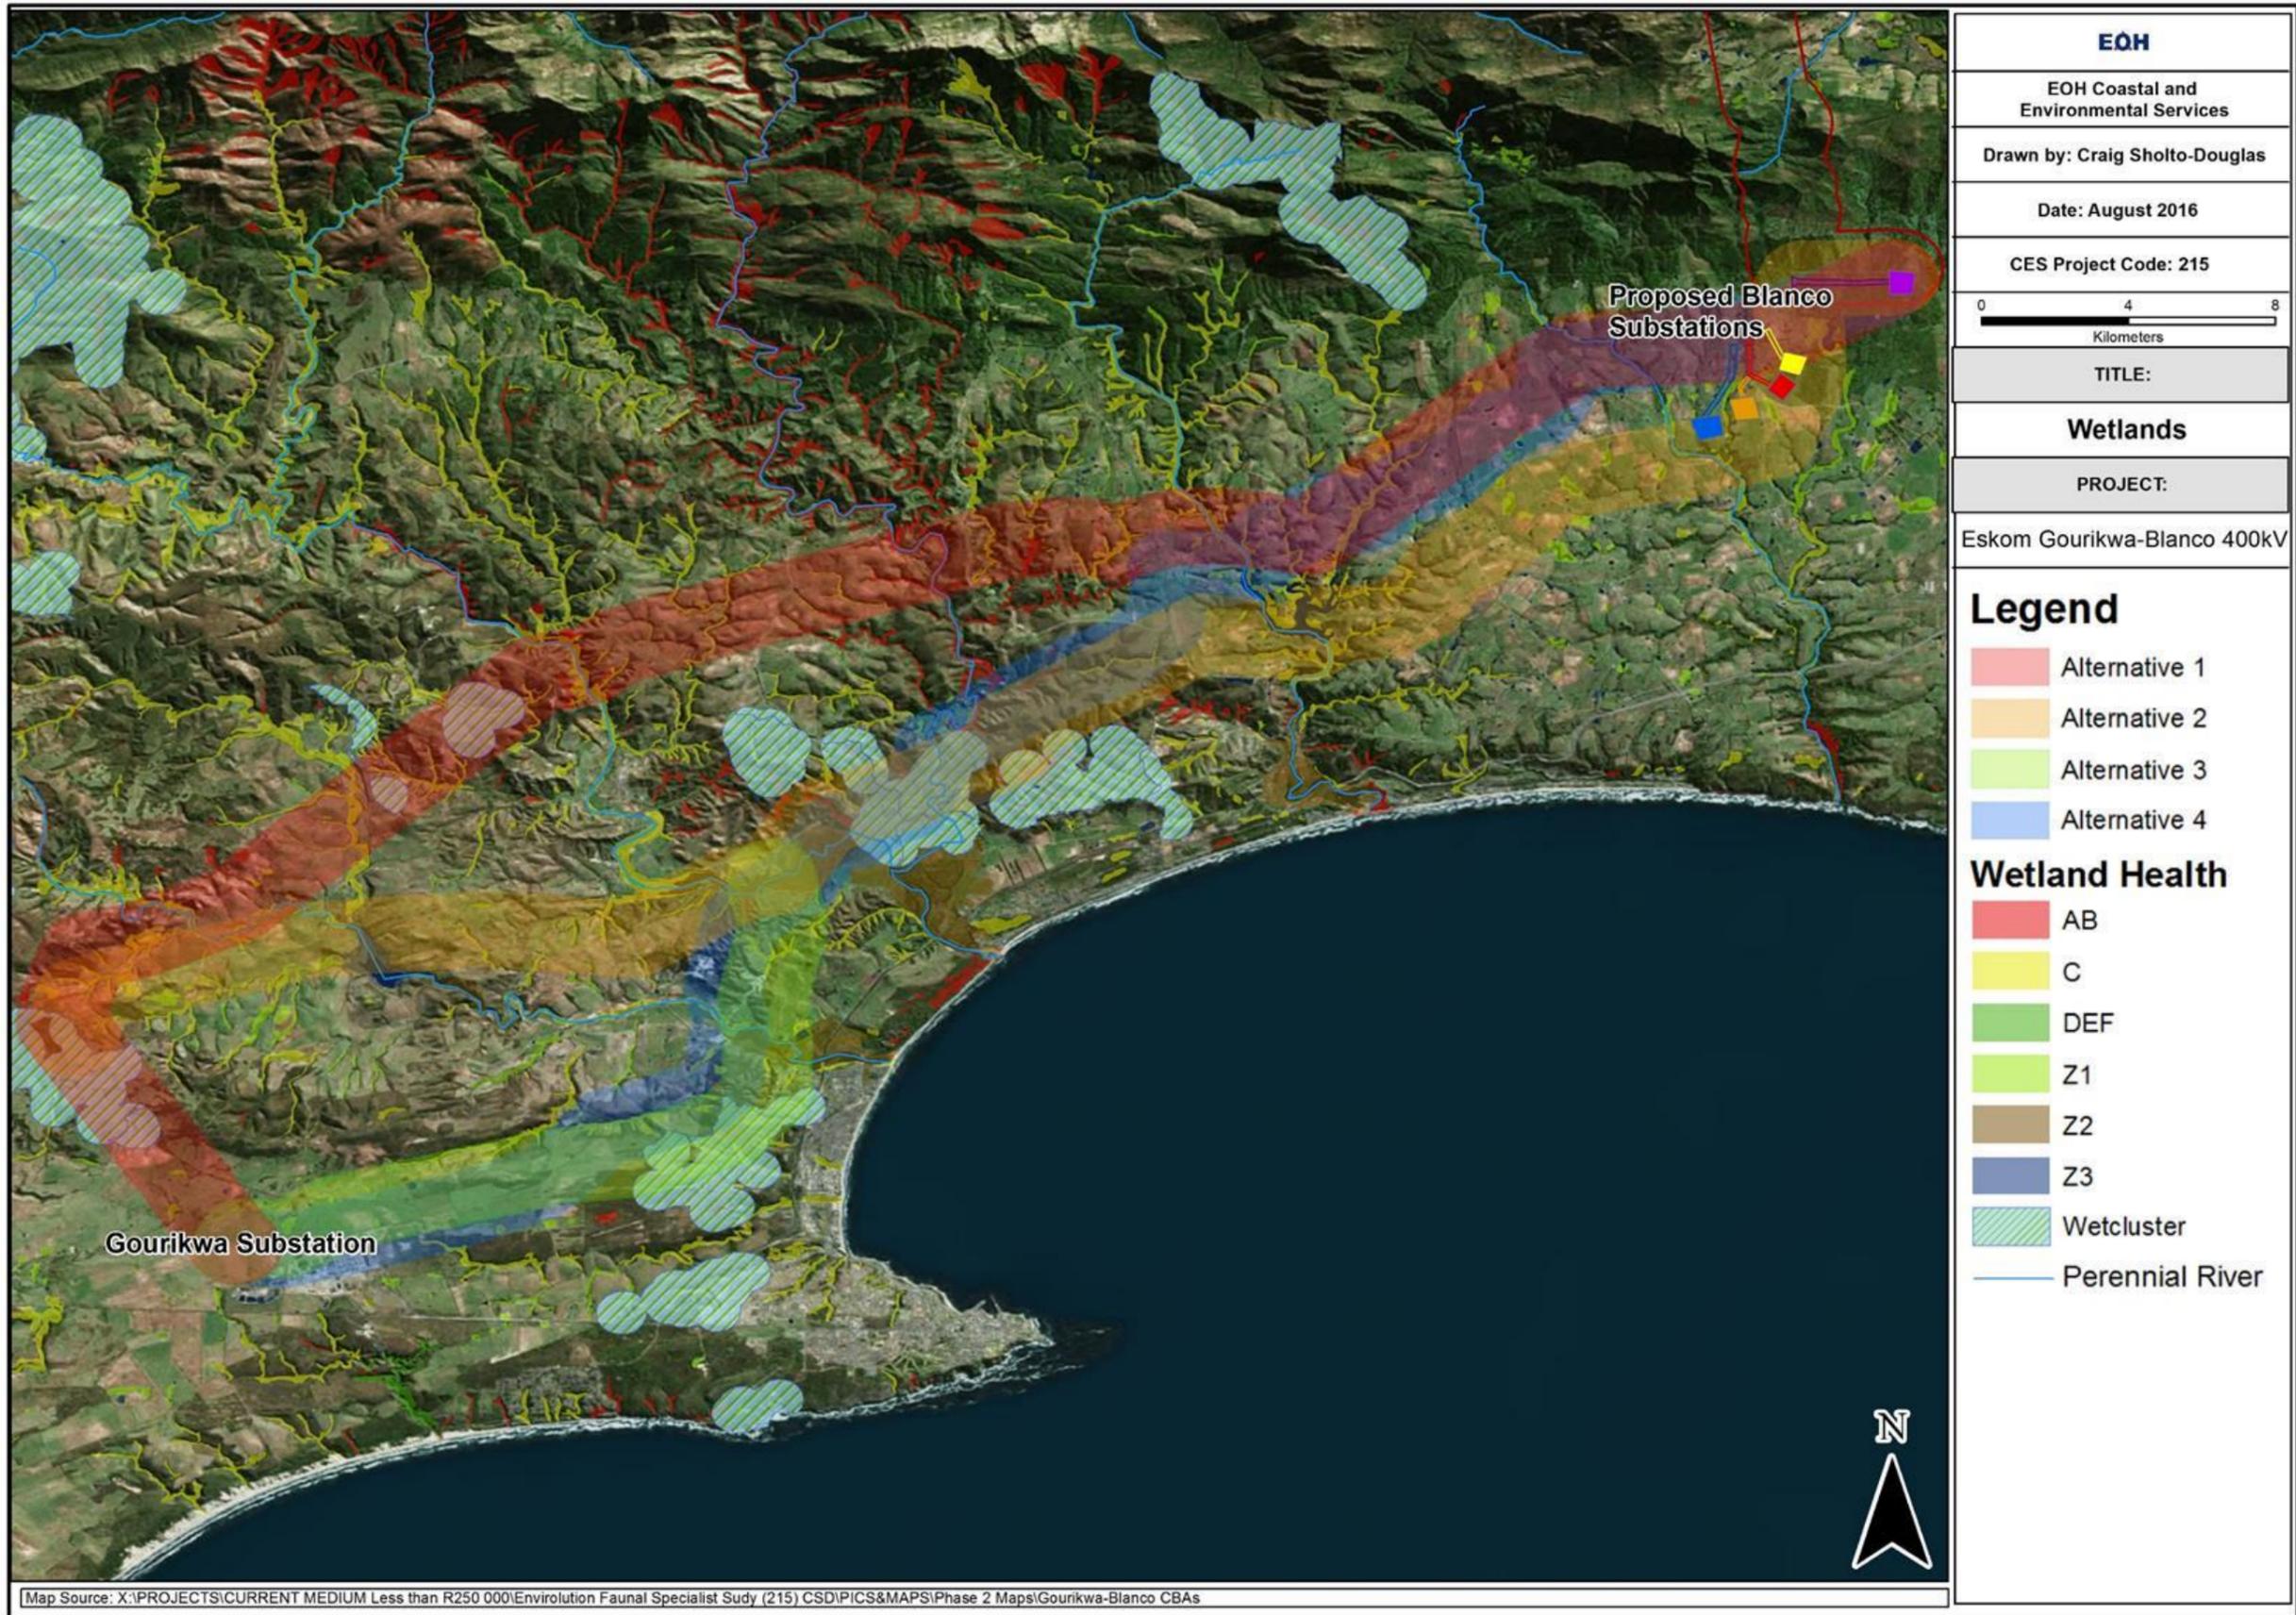

Figure 5-1: NFEPA Wetlands, Wetland Clusters, and Rivers within the project area

6. IMPORTANT BIRD AREAS

BirdLife's Important Bird and Biodiversity Area (IBAs) is a concept that has been developed and applied for over 30 years (BirdLife Intl.). Important Bird and Biodiversity Areas (IBAs) are:

- Places of international significance for the conservation of birds and other biodiversity;
- Recognised world-wide as practical tools for conservation;
- Distinct areas amenable to practical conservation action;
- Identified using robust, standardised criteria;
- Sites that together form part of a wider integrated approach to the conservation and sustainable use of the natural environment (BirdLife Intl.)

The only Important Bird Area (IBA) which might be affected by the proposed development is the Outeniqua Mountains IBA which is described below.

Outeniqua Mountains IBA

The Outeniqua Mountains contain fynbos, forest and arid-zone birds, including a number of restricted-range and biome-restricted species (BirdLife SA, 2016). A total of 277 species have been recorded for this area during SABAP2. Globally threatened species are Blue Crane (*Anthropoides paradiseus*), Ludwig's Bustard (*Neotis ludwigii*), Denham's Bustard (*Neotis denhami*), Secretarybird (*Sagittarius serpentarius*), Martial Eagle (*Polemaetus bellicosus*), Crowned Eagle (*Stephanoaetus coronatus*), Black Harrier (*Circus maurus*), Hottentot Buttonquail (*Turnix nanus*), Knysna Woodpecker (*Campethera notata*) and Knysna Warbler (*Bradypterus sylvaticus*) have all been recorded within the IBA (BirdLife SA, 2016). Regionally threatened species are Black Stork (*Ciconia nigra*), Verreaux's Eagle (*Aquila verreauxii*), African Marsh Harrier (*Circus ranivorus*), Lanner Falcon (*Falco biarmicus*), Cape Rockjumper (*Chaetops frenatus*) and Striped Flufftail (*Sarothrura affinis*) (BirdLife SA, 2016).

The IBA spans approximately 145 000 Ha and is Partially Protected with Global IBA statuses A1, A2, and A3 (BirdLife SA, 2016). Different sections of the IBA are under the jurisdiction of a number of government agencies, namely DAFF, CapeNature and SANParks (BirdLife SA, 2016). The size of protected areas in the IBA is being expanded, largely by decommissioning existing State forests (BirdLife SA, 2016). The Garden Route Initiative is currently bringing together stakeholders involved in conservation in this area to complete the formal process to register the IBA as a UNESCO Biosphere Reserve (BirdLife SA, 2016).

None of the four alternatives for the Gourikwa-Blanco power line cross or traverse the IBA until they all meet at the proposed Narina substation(s) at the south eastern corner of the IBA. However, all proposed alternatives run parallel to the IBA along the Outeniqua Mountains. Raptor SCC which are known to nest/roost within the IBA are expected to forage/hunt on the slopes and valleys surrounding the IBAs. Therefore, a 5 kilometres buffer around the IBA has been established (see Figure 6-1). For this reason, alternative 1 (which is the closest route option to the IBA) is likely to have a higher impact on large bodied birds than the other proposed alternatives.

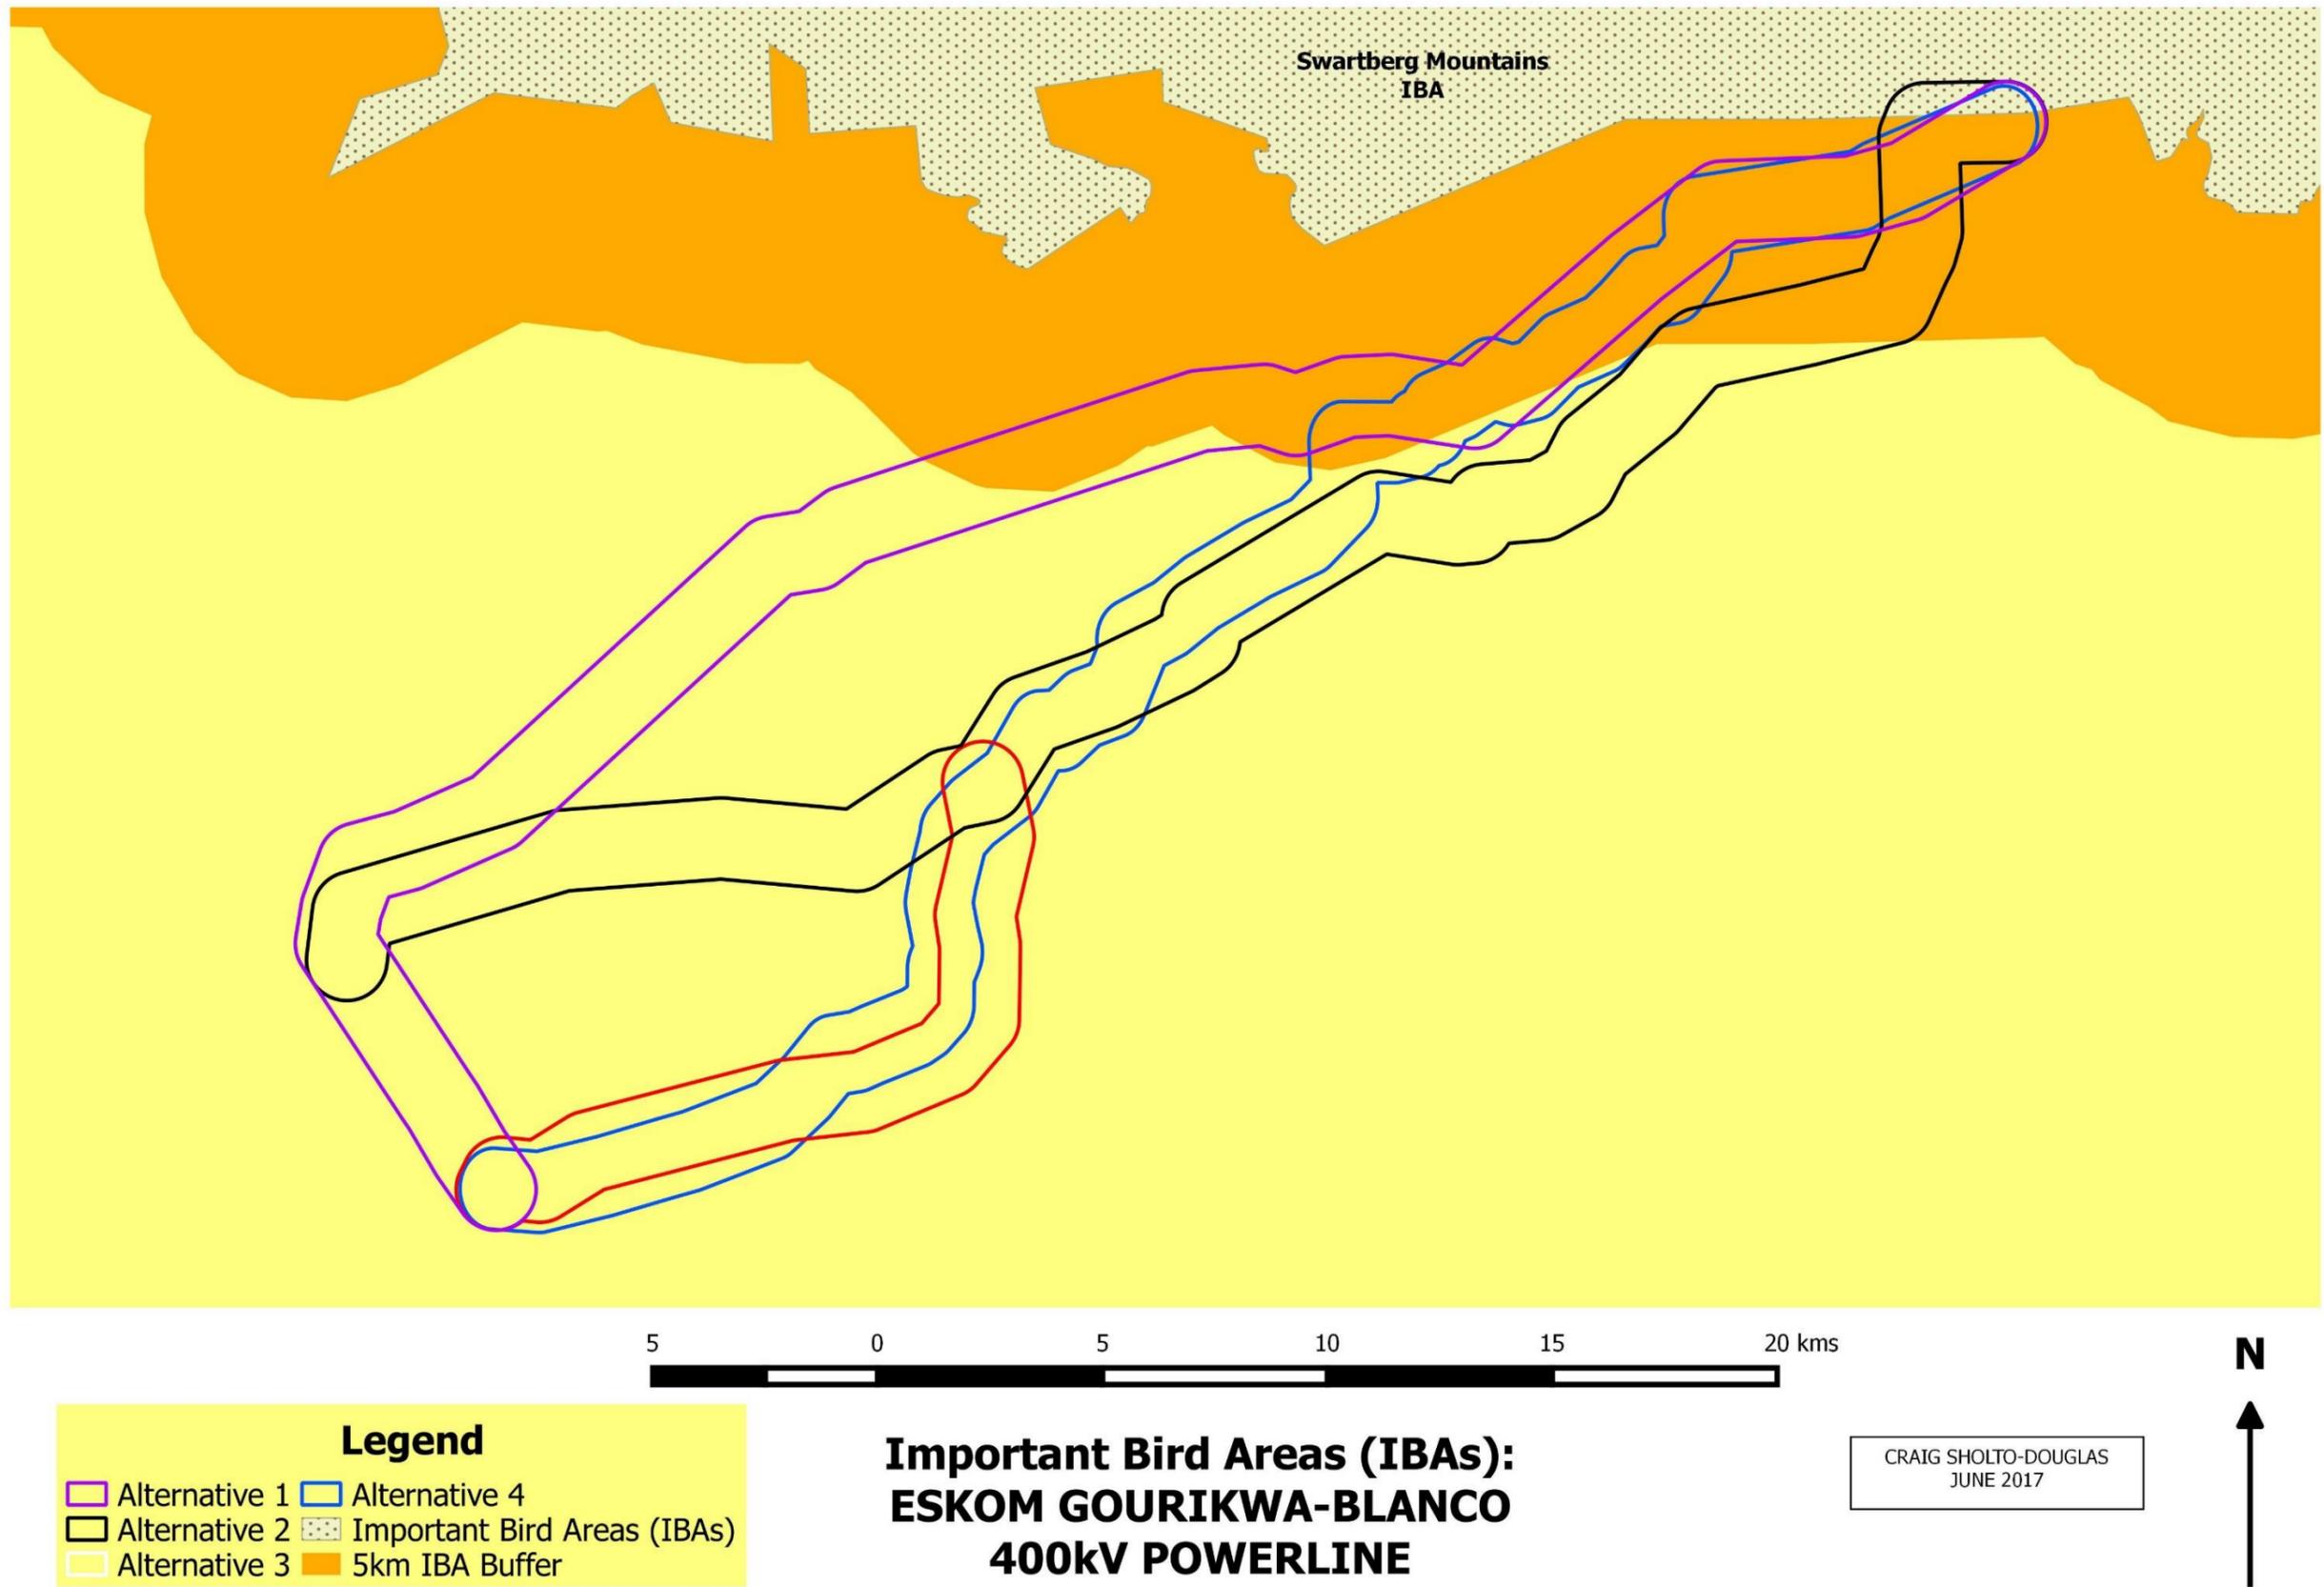

Figure 6-1: Important Bird Areas (IBAs)

7. AVIFAUNAL SPECIES AND HABITATS

7.1 Regional Overview of Birds

As result of the wide diversity of habitats found along the route of the proposed powerline there is a considerable number of bird species which have been recorded in the region (SABAP2). Bird records from the area have identified 314 bird species and the importance of the region is recognised by the presence of the Outeniqua Important Bird Area (IBAs), coastal habitats, numerous wetlands, and the ecotone between thicket and fynbos habitats. A total of 174 bird species were recorded during the survey, including 12 bird SCC and 6 'powerline priority species'. Please see Appendix A-1 for a full species list.

7.2 Bird SCC

There have been 30 bird species of conservation concern recorded in the area of the proposed powerline and alternative route (Table 7-1) of which four (4) are recorded as regionally endangered (EN).

Table 7-1: Bird SCC recorded along the Gourikwa-Blanco powerline routes

7.3 Powerline Priority Bird Species

The Eskom–Endangered Wildlife Trust Strategic Partnership has identified several interactions between birds and electrical infrastructure, highlighting the significant impacts that electrification can have on birds (Smallie *et al.*, 2009). Research indicates that the birds most prone to powerline (and associated infrastructure) impacts include vultures, eagles, cranes, bustards, storks, and flamingos (Smallie *et al.*, 2009), many of which are found within the proposed project area.

The list of “powerline priority species” found below (Table 7-2) is based on the bird species described in Smallie *et al.*, (2009), as well as electrocution and collision data relevant to the proposed powerline routes supplied by the Endangered Wildlife Trust (2016) and Eskom (2016). Although not all species listed are considered SCC, species which have historically been impacted on by powerline developments have been included. The list takes into account the likeliness of priority species to occur within/traverse the proposed alternatives.

Table 7-2: Gourikwa-Blanco Powerline Priority Species List

Common Name	Scientific name	Global Status	Regional Status	Electrocutions/collisions recorded by EWT/Eskom
Bustard, Denham's	<i>Neotis denhami</i>	NT	VU	-
Crane, Blue	<i>Anthropoides paradiseus</i>	VU	NT	✓
Eagle, African Crowned	<i>Stephanoaetus coronatus</i>	NT	VU	-

Stork, Black	<i>Ciconia nigra</i>	LC	VU	-
Stork, White	<i>Ciconia ciconia</i>	LC	LC	✓

Bird species most likely to be impacted on by the proposed powerline are described below.

Denham's Bustard (*Neotis denhami*), a regionally Vulnerable species, was recorded in fynbos on the foothills of the Outeniqua Mountain Range while conducting a driven transect along a section of proposed alternative 1. The species is known to occasionally frequent cultivate fields. As the species typically breeds in grasslands and lowland fynbos, proposed alternative 1 is likely to have the greatest impact on the species.

The globally Vulnerable **Blue Crane** (*Anthropoides paradiseus*) was recorded in cultivated pastures in the eastern section of the project area. In the Western Cape this species is known to frequent

agricultural fields, mostly composed of cereal crop fields and planted pastures. As the species have frequent local movements (usually from one agricultural area to another), all of the proposed powerline routes are likely to have an impact on the species. Powerline related mortalities for the species have been recorded in the project area (EWT, 2016).

The regionally Vulnerable **African Crowned Eagle** (*Stephanoaetus coronatus*) was not recorded during the field survey. However, the species has been recorded in the project area (SABAP2). The species prefers forest, alien plantations, and dense gorges. Based on the species habitat preference, proposed alternative 1 is likely to have the greatest impact on the species.

The globally Vulnerable and regionally Endangered **Martial Eagle** (*Polemaetus bellicosus*) is rare in mountainous areas, preferring open woodland in flat areas. The species is also known to utilise high-tension pylons as perches (Roberts, 2016). The species is likely to be impacted on by all of the proposed alternatives. Although the species was not recorded during the field survey, powerline related mortalities for the species have been recorded in the project area (EWT, 2016).

The regionally Vulnerable **Verreaux's Eagle** (*Aquila verreauxii*) was recorded during the survey approximately 3.5 kilometres to the east of the proposed Narina substations. The species strictly prefers mountainous areas with steep cliffs (used for nesting). Although the species nests on the Outeniqua Mountains to the north of the proposed alternatives, it is likely to forage in lower lying areas. Alternative 1 is likely to have the biggest impact on the species due to its proximity to the Outeniqua Mountains.

The Cape and Spotted **Eagle-Owls** (*Bubo sp.*) are both listed as species of Least Concern on regional and global Red Lists. However, powerline related mortalities for both of the species have been recorded in the project area (EWT, 2016). Spotted Eagle Owls (*Bubo africanus*) are found in a wide variety of habitats. The species is likely to be impacted on by all of the proposed alternatives. Cape Eagle Owls (*Bubo capensis*) roost and nest in caves and crevices associated with rocky habitats. Alternative 1 is likely to have the greatest impact on this species.

Spur-winged Goose (*Plectropterus gambensis*) and **White Stork** (*Ciconia ciconia*) are both listed as species of Least Concern on regional and global Red Lists. However, powerline related mortalities for both species have been recorded in the project area (EWT, 2016). Both species are known to frequent agricultural fields and cultivated lands, therefore all of the proposed powerline routes are likely to have an impact on both species.

Although no powerline related mortalities have been recorded in the area for the regionally Vulnerable **Black Stork** (*Ciconia nigra*) and the globally and regionally Vulnerable **Secretarybird** (*Sagittarius serpentarius*), powerline related mortalities outside the project area have been recorded. Secretarybirds were recorded in grassland habitats during the field survey and Black Storks have been recorded during SABAP2. Habitats suitable for both species are found throughout the greater project area, therefore all of the proposed alternatives are likely to have an impact on both species.

8. SENSITIVITY

8.1 Site sensitivity

The sensitivity map illustrated below (Figure 8-1) was developed using available spatial planning tools (e.g. NFEPA, IBAs, Protected Areas, CBAs, etc), distribution ranges of SCC, process areas such as perennial rivers and pristine wetlands, and specialist ecological knowledge. Areas defined as “sensitive” during the desktop scoping phase were visited during a field survey to verify sensitivities and conduct checklists of species present on site, as well as the likeliness of species to occur within areas due to habitat preferences.

Identified **No-Go** areas (unless recommendations and mitigation measures are implemented) include:

- **Rocky outcrops** on the Outeniqua Mountain range (IBA) which provide suitable breeding/nesting sites for raptors of conservation concern (location of substation option 5).
- **All breeding and roosting sites** encountered during the construction phase.

Identified areas of **high sensitivity** include:

- Important Bird Areas (IBAs) and nesting areas for bird SCC; and
- Formal Protected Areas.

Areas of **medium sensitivity** include:

- Wetlands according to NFEPA;
- Critical Biodiversity Areas; and a
- 5km buffer around the IBA.

Areas of **low sensitivity** include:

- Areas that are highly impacted by current land use and provide little value to the ecosystem; and
- Highly degraded areas.

An avifaunal sensitivity map has been created to illustrate areas of high, medium and low sensitivity (Figure 8-1). This map has been created as a guide to identify the preferred route for the field survey. **Images associated to the numbers found on the Figure can be seen in Plate 8-1 below.**

9. KEY AVIFAUNAL ISSUES AND IMPACT STATEMENT

9.1 Introduction

This chapter details the avifaunal impacts identified by the specialist consultants during the specialist studies phase. For each issue identified, details are provided, followed by the mitigation measures required to minimise the negative impacts associated with the issue. The impact rating methodology used to determine the impacts below is presented in Appendix B-1 of this report.

The main impacts likely to be caused by power lines being constructed along either Alternative Route 1, 2, 3 or 4 will include:

1. Loss of Bird Habitat
2. Disturbance and Displacement of Birds
3. Loss of Bird Diversity and SCC

9.2 Alternative 1 – Preferred power line route which runs between Gourikwa and the proposed Blanco substations

Nature: 1 – Loss of Bird Habitat

Construction: There will be some loss of bird habitat through the clearing of vegetation for service/access roads and the construction of pylon bases. The extent of habitat loss will be dependent on how many new service/access roads need to be made and the number of pylon bases required. This is usually a loss of vegetation (plant communities) that supply food and shelter, but may include abiotic features such as the loss of temporary wetlands, caves or rocky outcrops, which provide suitable nesting or roosting sites.

All routes will pass through numerous private game reserves (Gondwana, Hertenbos, Nyaru, Botlierskop) and CBAs at certain sections of the respective routes. The survey found that alternative 1 will pass through the most 'intact' habitats of all of the proposed route options. Alternative 1 is also the closest route to the Outeniqua Mountains IBA. A substantial portion of this route option falls within the 5km buffer around the Outeniqua IBA. Various pristine rivers and drainage lines fed by the Outeniqua Mountains will need to be traversed along this route option. Construction of pylon hardstands and road infrastructures through these areas will fragment and destroy habitats utilised by numerous bird species.

Operation: During operation there will be the need to keep the area beneath the power lines clear which will involve grass cutting and shrub clearance where necessary.

The creation of new roads may provide access to previously inaccessible areas which may increase poaching rates or natural resource use.

	Without mitigation	With mitigation
Construction Phase		
Probability	5 - Definite (regardless of measures to prevent)	5 - Definite (regardless of measures to prevent)
Duration	2 – Short Duration (1-2 years)	1 - Very Short Duration (0 -1 year)
Extent	2 - Limited to the local area	1 - Limited to the site
Magnitude	4 – Low , with slight impact on processes	4 - Low , with slight impact on processes
Significance	40 (Medium)	30 (Medium)
Status (positive or negative)	Negative	Negative
Operation Phase		

Probability	3 - Probable (distinct possibility)	3 - Probable (distinct possibility)
Duration	5 - Permanent (ongoing during lifetime)	5 - Permanent (ongoing during lifetime)
Extent	1 - Limited to the site	1 - Limited to the site
Magnitude	0 - Small or no effect	0 - Small or no effect
Significance	18 (Low)	18 (Low)
Status (positive or negative)	Negative	Negative
Reversibility	Moderate	Moderate
Irreplaceable loss of resources?	Low	Low
Can impacts be mitigated?	YES	-
Mitigation:		
<p>Construction: Where access roads and/or pylon bases do need to be located within any of the sensitive areas identified above then there should be further ground-truthing by an avifaunal specialist to determine exact road routes and pylon base locations so to, where possible, avoid site specific sensitive areas such as nests and roosts</p> <p>All bird nest/roost sites encountered should be considered “No-Go” areas for any pylon hardstands or the construction of access roads.</p> <p>Wherever possible existing service/access roads should be used.</p> <p>Construction areas should be demarcated with hazard tape and no clearing must occur outside of these areas. Laydown areas and construction camps must be located in areas of low sensitivity. Where this is not feasible then in areas of medium sensitivity.</p> <p>An ECO must be employed to monitor the clearing for roads and hardstands.</p> <p>Operation: Clearing of vegetation for maintenance of the servitude should be kept to the authorised servitude of 62m</p> <p>Access to all access/service roads should be limited by having locked gates.</p>		
Cumulative impacts: The erection of addition power lines will further fragment natural habitats along the route option		
Residual Risks: Maintenance of new service/access roads will prevent habitat regeneration.		

Nature: 2 - Disturbance and Displacement of Birds

Construction: Birds will be disturbed by the powerline construction activities (e.g. noise, dust, operation of heavy machinery, anthropogenic activities). There is the potential for some nesting birds to be displaced during construction activities where service/access roads and pylon bases are located within a close proximity to nesting sites. This impact will be greater for Alternative 1 compared to the other route options as alternative 1 will pass through the most ‘intact’ habitats of all of the proposed route options. Alternative 1 is also the closest route to the Outeniqua Mountains IBA.

Operation: Birds will utilise pylons to construct nests or to use as roosts. There will be continued disturbance during the operation of the powerline due to maintenance activities. The powerline infrastructures can also act as a barrier for birds in flight, and can influence flight paths of migratory species.

	Without mitigation	With mitigation
--	---------------------------	------------------------

Construction Phase		
Probability	4 - Highly Probable (most likely)	3 - Probable (distinct possibility)
Duration	2 - Short Duration (2-5 year)	1 - Very Short Duration (0 -1 year)
Extent	2 - Limited to local area	2 - Limited to local area

Duration	5 - Permanent (ongoing during lifetime)	5 - Permanent (ongoing during lifetime)
Extent	2 - Limited to local area	2 - Limited to local area
Magnitude	2 - minor and will not result in an impact on processes	2 - minor and will not result in an impact on processes
Significance	27 (Low)	27 (Low)
Status (positive or negative)	Negative	Negative
Reversibility	Moderate	Moderate
Irreplaceable loss of resources?	Low	Low
Can impacts be mitigated?	YES	YES
Mitigation:		
<p>All bird nest/roost sites encountered should be considered “No-Go” areas for any pylon hardstands or the construction of access roads.</p> <p>An avifaunal specialist should be employed during the pre-construction and construction phases to ground-truth the proposed pylon hardstand areas.</p> <p>Any nests of raptors of SCC encountered during ground-truthing should be avoided – no construction activities must take place within a 500m radius of these areas.</p> <p>Any birds encountered should be allowed to move away from the construction area.</p> <p>Driving should be restricted to day-light hour. Driving before sunrise and after sunset should be restricted to emergencies only.</p> <p>Wherever possible existing service/access roads should be used.</p> <p>Bird friendly line and pole design must be used – along with industry standard insulation of all conductors and line-pylon attachment infrastructures.</p> <p>Bird nests on pylon infrastructures must not be removed during the breeding season.</p>		
Cumulative impacts: There will be a cumulative disturbance due to the additional anthropogenic activities associated with constructing and maintaining an additional powerline along the route. There will be an additional barrier for birds in flight/migratory species.		
Residual Risks: The presence of power lines will remain a risk to birds.		

Nature: 3 - Loss of Bird Diversity and SCC

Construction: There may be some disturbance of bird species during construction phase but this will probably be limited to very local and short-term disturbance. Some birds, particularly nocturnal species such as owls and night-jars may be killed on the roads if there is an increase in the number of project vehicles using roads at night.

Operation: The main issue during the operation phase is the possibility of bird species colliding with the power lines while in flight or being electrocuted by contacting live parts of the system. As there are numerous bird species of conservation concern which inhabit the project area, the likelihood of collision is high and the potential impact is significant. The length of the power line and the abundance of habitats associated to different bird species compositions further exacerbate the potential impact. Alternative 1 runs parallel to the Outeniqua Mountains and is the closest route option to the Outeniqua IBA. A substantial portion of this route option falls within the 5km buffer around the Outeniqua IBA. For this reason collisions/impact with foraging bird species are more likely than the other alternatives. During the survey, the majority of flights recorded by large-bodied birds occurred closest to the proposed alternative 1.

Significance	70 (High)	55 (Medium)
Status (positive or negative)	Negative	Negative
Reversibility	Moderate	Moderate
Irreplaceable loss of resources?	Low	Low
Can impacts be mitigated?	YES	-
Mitigation:		
During the construction phase there should no construction during the hours of darkness.		
Speed restrictions for all project vehicles (40km/h is recommended) should be in place to reduce		

the impact of birds being killed on the project roads.

Wherever possible existing service/access roads should be used.

Bird flight diverters should be attached to power lines from Gondwana Private Game Reserve to the proposed Blanco Substation. This is due to the proximity of the alternative to the Outeniqua Mountain IBAs - the spacing intervals must be a **minimum of 5m** apart in these areas.

The power line should be constructed in close proximity to the existing power line as many birds will be aware of the existing infrastructure which may reduce collisions in low visibility conditions.

All areas defined as having a medium avifaunal sensitivity must have bird diverters installed (spacing to be determined following ground-truthing). These areas include suitable habitat for numerous powerline priority species (e.g. cranes, bustards, and storks).

Cumulative impacts: This additional power line adds to the already existing power lines in the area and therefore increases the risk of bird collisions and deaths.

Residual Risks: The presence of power lines will remain a risk to flying birds.

9.3 Alternative Options 2, 3 & 4 – Power line routes which run between Gourikwa and the proposed Blanco substations

Nature: 1 – Loss of Bird Habitat

Construction: There will be some loss of bird habitat through the clearing of vegetation for service/access roads and the construction of pylon bases. The extent of habitat loss will be dependent on how many new service/access roads need to be made and the number of pylon bases required. This is usually a loss of vegetation (plant communities) that supply food and shelter, but may include abiotic features such as the loss of temporary wetlands, caves or rocky outcrops, which provide suitable nesting or roosting sites.

The survey found that alternatives 2, 3 & 4 pass through more degraded habitats than Alternative 1. These three options are further away from the Outeniqua Mountains IBA. However, the routes will pass through numerous private game reserves and CBAs, as well as large wetland systems which provide suitable habitat for waterbird guilds. Construction of pylon hardstands and road infrastructures through these habitats will have an impact on available bird habitat.

Operation: During operation there will be the need to keep the area beneath the power lines clear which will involve grass cutting and shrub clearance where necessary.

The creation of new roads may provide access to previously inaccessible areas which may increase poaching rates or natural resource use.

Can impacts be mitigated?	YES	-
Mitigation:		
<p>Construction: Where access roads and/or pylon bases do need to be located within any of the sensitive areas identified above then there should be further ground-truthing by an avifaunal specialist to determine exact road routes and pylon base locations so to, where possible, avoid site specific sensitive areas such as nests and roosts</p> <p>All bird nest/roost sites encountered should be considered “No-Go” areas for any pylon hardstands or the construction of access roads.</p> <p>Wherever possible existing service/access roads should be used.</p> <p>Construction areas should be demarcated with hazard tape and no clearing must occur outside of these areas. Laydown areas and construction camps must be located in areas of low sensitivity. Where this is not feasible then in areas of medium sensitivity.</p> <p>An ECO must be employed to monitor the clearing for roads and hardstands.</p> <p>Operation: Clearing of vegetation for maintenance of the servitude should be kept to the authorised servitude of 62m</p> <p>Access to all access/service roads should be limited by having locked gates.</p>		
Cumulative impacts: The erection of addition power lines will further fragment natural habitats along the route option		
Residual Risks: Maintenance of new service/access roads will prevent habitat regeneration.		

Nature: 2 - Disturbance and Displacement of Birds

Construction: Birds will be disturbed by the powerline construction activities (e.g. noise, dust, operation of heavy machinery, anthropogenic activities). There is the potential for some nesting birds to be displaced during construction activities where service/access roads and pylon bases are located within a close proximity to nesting sites.

Operation: Birds will utilise pylons to construct nests or to use as roosts. There will be continued disturbance during the operation of the powerline due to maintenance activities. The powerline infrastructures can also act as a barrier for birds in flight, and can influence flight paths of migratory species.

Significance	27 (Low)	27 (Low)
Status (positive or negative)	Negative	Negative
Reversibility	Moderate	Moderate
Irreplaceable loss of resources?	Low	Low
Can impacts be mitigated?	YES	YES
Mitigation:		
<p>All bird nest/roost sites encountered should be considered “No-Go” areas for any pylon hardstands or the construction of access roads.</p> <p>An avifaunal specialist should be employed during the pre-construction and construction phases to ground-truth the proposed pylon hardstand areas.</p> <p>Any nests of raptors of SCC encountered during ground-truthing should be avoided – no construction activities must take place within a 500m radius of these areas.</p> <p>Any birds encountered should be allowed to move away from the construction area.</p> <p>Driving should be restricted to day-light hour. Driving before sunrise and after sunset should be restricted to emergencies only.</p> <p>Wherever possible existing service/access roads should be used.</p> <p>Bird friendly line and pole design must be used – along with industry standard insulation of all conductors and line-pylon attachment infrastructures.</p> <p>Bird nests on pylon infrastructures must not be removed during the breeding season.</p>		
Cumulative impacts: There will be a cumulative disturbance due to the additional anthropogenic activities associated with constructing and maintaining an additional powerline along the route. There will be an additional barrier for birds in flight/migratory species.		
Residual Risks: The presence of power lines will remain a risk to birds.		

Nature: 3 - Loss of Bird Diversity and SCC**Construction:** There may be some disturbance of bird species during construction phase but

this will probably be limited to very local and short-term disturbance. There may be the possibility of the loss of some nesting birds as a result of vegetation removal. Some birds, particularly nocturnal species such as owls and night-jars may be killed on the roads if there is an increase in the number of project vehicles using roads at night.

Operation: The main issue during the operation phase is the possibility of bird species colliding with the power lines while in flight or being electrocuted by contacting live parts of the system. As there are numerous bird species of conservation concern which inhabit the project area, the likelihood of collision is high and the potential impact is significant. The length of the power line and the abundance of habitats associated to different bird species compositions further exacerbate the potential impact. The route options (2, 3 & 4) will pass through numerous private game reserves and CBAs, as well as large wetland systems which provide suitable habitat for waterbird guilds which are likely to migrate between water bodies. All of the route options enter the 5 km IBA buffer in the eastern part of the project area, close to the proposed substation locations.

Status (positive or negative)	Negative	Negative
Reversibility	Moderate	Moderate
Irreplaceable loss of resources?	Low	Low
Can impacts be mitigated?	YES	-
Mitigation: During the construction phase there should no construction during the hours of darkness.		
Speed restrictions for all project vehicles (40km/h is recommended) should be in place to reduce the impact of birds being killed on the project roads.		
Wherever possible existing service/access roads should be used.		

The power line should be constructed in close proximity to the existing power line as many birds will be aware of the existing infrastructure which may reduce collisions in low visibility conditions.

All areas defined as having a medium avifaunal sensitivity must have bird diverters installed (spacing to be determined following ground-truthing). These areas include suitable habitat for numerous powerline priority species (e.g. cranes, bustards, and storks).

Cumulative impacts: This additional power line adds to the already existing power lines in the area and therefore increases the risk of bird collisions and deaths.

Residual Risks: The presence of power lines will remain a risk to flying birds.

9.4 Substations – Impact Statements for the proposed Blanco substations

Nature: 1 - Impact of substations 1, 2, & 3 on avifauna

Construction: Proposed substations 1, 2, & 3 are all located within agricultural lands in areas defined as having a low faunal sensitivity. Proposed substation 2 is located adjacent to an existing substation. There will be some loss of avifaunal habitats through the clearing of vegetation for the construction of substation infrastructures.

Operation: The main issue during the operation phase is the possibility of bird species being electrocuted by contacting live parts of the substation system. As there are numerous bird species of conservation concern which inhabit the project area.

Nature: 1 - Impact of substation 4 on avifauna

Construction: Substation 4 is located within agricultural lands in an area defined as having a low faunal sensitivity. However, the proposed footprint of the substation overlaps with riparian habitats (including a perennial stream) which has been classified as having a medium sensitivity. There will be some loss of avifaunal habitats through the clearing of vegetation for the construction of substation infrastructures.

Operation: The main issue during the operation phase is the possibility of bird species being electrocuted by contacting live parts of the substation system. As there are numerous bird species of conservation concern which inhabit the project area.

Nature: 1 - Impact of substation 5 on avifauna

Construction: Substation 5 is located within a matrix of alien and fynbos vegetation at the foothills of the Outeniqua Mountains. The proposed substation access road route runs through many moderately defined streams parallel to the Outeniqua Mountain IBA (within 1 km) and a formally protected area. There will be some loss of faunal habitats through the clearing of vegetation for the construction of substation infrastructures.

Operation: The main issue during the operation phase is the possibility of bird species being electrocuted by contacting live parts of the substation system. As there are numerous bird species of conservation concern which inhabit the project area, the likelihood of collision/electrocutions are high without mitigation. Due to the proximity to the Outeniqua Mountains IBA the proposed alternative is likely to have a greater impact on birds than the other proposed alternatives.

	Without mitigation	With mitigation

Irreplaceable loss of resources?	Low	Low
Can impacts be mitigated?	YES	-
Mitigation:		
Where possible, all aquatic habitats such as rivers and streams must be avoided.		
Wherever possible existing service/access roads should be used.		
Vehicle speed should be limited to the lowest possible, and should not exceed 40km/h.		
Where possible any material to be transported should be in covered trucks or containers to avoid contamination to the surrounding area.		
Speed restrictions for all project vehicles (40km/h is recommended) during the construction and operation phases should be in place to reduce the impact of mammals being killed on the project roads.		
Driving should be restricted to day-light hours. Driving before sunrise and after sunset should be restricted to emergencies only.		
Clearing of vegetation should be kept to a minimum and all rocky outcrops and wetlands must		

be avoided.

Construction areas should be demarcated with hazard tape and no clearing to occur outside of these areas. Laydown areas and construction camps must be located in areas of low sensitivity.

An ECO must be employed to monitor the clearing for roads and substation foundations.

Maintain habitat connectivity, particularly to intact habitats, via habitat corridors.

Wherever possible existing service/access roads should be used.

Access to all access/service roads should be limited by having locked gates.

There must be proper storage of all oils and fuels at all construction sites and operational substations so as not to pollute nearby wetlands or waterways.

Bird diverters should be installed on all substation infrastructures.

10. AVIFAUNAL SUMMARY AND RECOMMENDATIONS

10.1 Greater Project Area

Consultation of historical records and species distribution data indicates a vast diversity of bird species are likely to be found in a variety of habitats within the greater project area. Furthermore, numerous bird SCC are likely to be found within the project area.

10.1.1 Alternatives

Alternative 1 is likely to have the greatest overall impact on avifauna in the area due to i) the proximity of the route to the Outeniqua Mountains IBA and protected areas, ii) due the number of privately owned game reserves and CBAs which the route will traverse, and iii) the number of pristine perennial rivers and streams along the route. The overall habitat along proposed alternative 1 is in better condition than the other alternatives. Alternative 2 is the preferred alternative from an avifaunal perspective. Alternative 2 passes through less sensitively defined habitats than alternative 1. An existing powerline traverses certain moderately defined areas along alternative 2 (Botlierskop Game Reserve and Wolwedans Dam) and therefore service road infrastructures are already in place.

Gourikwa – Blanco Alternative 1

Impact	Without mitigation	With mitigation

5. Disturbance and Displacement	24 (Low)	15 (Low)
6. Loss of Bird Diversity and SCC	21 (Low)	14 (Low)
Operation Phase		
4. Loss of Bird Habitat	18 (Low)	18 (Low)
5. Disturbance and Displacement	27 (Low)	27 (Low)
6. Loss of Bird Diversity and SCC	60 (Medium/High)	44 (Medium)

Recommendations

Alternative 2 is the preferred alternative from an avifaunal perspective. There are existing powerline infrastructures which mitigates many of the impacts associated with birds and powerlines. The existing service roads will result in less bird habitat being destroyed or fragmented during the construction phase of the project. Alternative 1 (preferred) is likely to have the greatest overall impact on avifauna of all of the route options due to its proximity to the Outeniqua IBA. Should alternative 1 be chosen, it is recommended that bird diverters are installed on all powerline infrastructure between Gondwana Private Game Reserve and the chosen Narina Substation as it is anticipated that numerous bird SCC will utilise these areas for hunting/foraging.

Where access roads and/or pylon bases do need to be located within any of the identified sensitive areas then there should be further ground-truthing by an avifaunal specialist to determine exact road routes and pylon base locations so to, where possible, avoid site specific sensitive areas such as nests and roosts. All bird nest/roost sites encountered should be considered “No-Go” areas for any pylon hardstands or the construction of access roads. The power line should be constructed in close proximity to the existing power line as many birds will be aware of the existing infrastructure which may reduce collisions in low visibility conditions. All areas defined as having a medium avifaunal sensitivity must have bird diverters installed (spacing to be determined following ground-truthing). These areas include suitable habitat for numerous powerline priority species (e.g. cranes, bustards, and storks).

10.1.2 Substations

Although options 1, 2 and 3 have the same impact rating, and are located in an area that will have the least impact on avifauna, substation 2 is the preferred substation option from an avifaunal perspective as there is an existing substation in the immediate vicinity and very little sensitive habitat surrounding the site. Option 4 is not recommended as there are sensitive riparian areas which will be impacted on by the construction of a substation. Option 5 is strongly not recommended as it is located within a matrix of alien and fynbos vegetation at the foothills of the Outeniqua Mountains. The proposed substation access road for option 5 will traverse many moderately defined streams parallel to the Outeniqua Mountain IBA (within 1 km) and a formally protected area.

Substations

Impact	Without mitigation	With mitigation
Construction Phase		
1. Substations 1, 2, & 3	35 (Medium)	15 (Low)
2. Substation 4	45 (Medium)	21 (Low)
3. Substation 5	45 (Medium)	21 (Low)
Operation Phase		
1. Substation 1, 2, & 3	44 (Medium)	24 (Low)
2. Substation 4	44 (Medium)	24 (Low)
3. Substation 5	52 (Medium)	30 (Medium)

11. CONCLUSION

From an avifaunal perspective it is recommended that the Gourikwa - Blanco Alternative 2 is the preferred route option for the proposed power line, providing the recommended mitigation measures are implemented. There are existing powerline infrastructures which mitigate many of the impacts associated with birds and powerlines. The existing service roads will result in less bird habitat being destroyed or fragmented during the construction phase of the project. Should alternative route option 1 be chosen, bird diverters should be attached to the powerlines from Gondwana Private Game Reserve to the proposed Blanco Substation. It is recommended that an avifaunal walkthrough of the final route option is done prior to construction to determine any sensitive areas that need to be avoided. All bird nest/roost sites encountered should be considered “**No-Go**” areas for any pylon hardstands or the construction of access roads. The power line should be constructed in close proximity to the existing power line as many birds will be aware of the existing infrastructure which may reduce collisions in low visibility conditions. All areas defined as having a medium avifaunal sensitivity must have bird diverters installed (spacing to be determined following ground-truthing).

APPENDIX B-1 - IMPACT RATINGS METHODOLOGY

Direct, indirect and cumulative impacts of the issues identified through the scoping study, as well as all other issues identified in the EIA phase have been assessed and quantified using the following a standard impact ratings scale. This is necessary since impacts have a number of parameters that need to be assessed. Factors that need to be considered when assessing the significance of impacts are assessed in terms of the following criteria:

- The **nature**, which shall include a description of what causes the effect, what will be affected and how it will be affected.
- The **extent**, wherein it will be indicated whether the impact will be local (limited to the immediate area or site of development) or regional, and a value between 1 and 5 will be assigned as appropriate (with 1 being low and 5 being high):
- The **duration**, wherein it will be indicated whether:
 - the lifetime of the impact will be of a very short duration (0–1 years) – assigned a score of 1;
 - the lifetime of the impact will be of a short duration (2-5 years) - assigned a score of 2;
 - medium-term (5–15 years) – assigned a score of 3;
 - long term (> 15 years) - assigned a score of 4; or
 - permanent - assigned a score of 5;
- The **consequences (magnitude)**, quantified on a scale from 0-10, where 0 is small and will have no effect on the environment, 2 is minor and will not result in an impact on processes, 4 is low and will cause a slight impact on processes, 6 is moderate and will result in processes continuing but in a modified way, 8 is high (processes are altered to the extent that they temporarily cease), and 10 is very high and results in complete destruction of patterns and permanent cessation of processes.
- The **probability of occurrence**, which shall describe the likelihood of the impact actually occurring. Probability will be estimated on a scale of 1–5, where 1 is very improbable (probably will not happen), 2 is improbable (some possibility, but low likelihood), 3 is probable (distinct possibility), 4 is highly probable (most likely) and 5 is definite (impact will occur regardless of any prevention measures).
- the **significance**, which shall be determined through a synthesis of the characteristics described above and can be assessed as low, medium or high; and
- the status, which will be described as either positive, negative or neutral.
- the degree to which the impact can be reversed.
- the degree to which the impact may cause irreplaceable loss of resources.
- the degree to which the impact can be mitigated.

The **significance** is calculated by combining the criteria in the following formula:

$$S = (E+D+M) P$$

Where : S = Significance weighting
 E = Extent
 D = Duration
 M = Magnitude
 P = Probability

The **significance weightings** for each potential impact are calculated using the following ratings values:

Probability		Duration	
1. Very improbable 2. Improbable (low likelihood) 3. Probable (distinct possibility) 4. Highly Probable (most likely) 5. Definite (regardless of measures to prevent)		1. Very Short Duration (0 -1 year) 2. Short Duration (2 -5 years) 3. Medium Term (5 – 15 years) 4. Long Term (>15 years) 5. Permanent (ongoing during lifetime)	
Extent		Magnitude	
1. Limited to site 2. Limited to the local area 3. Limited to the region 4. National 5. International		0. Small or no effect 2. Minor or no impact on processes 4. Low, with slight impact on processes 6. Moderate (processes continue but modified) 8. High (processes altered & stop temporarily) 10. Very High & destructive of pattern with processes permanently stopped)	
Significance Score = Magnitude + Duration + Extent x Probability			
Significance	< 30 LOW	30 – 60 MEDIUM	> 60 HIGH

Each issue and its impact is presented and summarised in the following table:

Nature: [Outline and describe fully the impact anticipated as per the assessment undertaken]		
	Without mitigation	With mitigation
Construction Phase		
Probability		
Duration		
Extent		
Magnitude		
Significance	65 (High)	44 (Medium)
Status (positive or negative)	Negative	Negative
Operation Phase		
Probability		
Duration		

Extent		
Magnitude		
Significance	65 (High)	44 (Medium)
Status (positive or negative)	Negative	Negative
Reversibility	Low	Moderate
Irreplaceable loss of resources?	Moderate	Low
Can impacts be mitigated?		
<p>Mitigation:</p> <p>“Mitigation”, means to anticipate and prevent negative impacts and risks, then to minimise them, rehabilitate or repair impacts to the extent feasible.</p> <ul style="list-style-type: none"> • Provide a description of how these mitigation measures will be undertaken keeping the above definition in mind. 		
<p>Cumulative impacts: “Cumulative Impact”, in relation to an activity, means the past, current and reasonably foreseeable future impact of an activity, considered together with the impact of activities associated with that activity, that in itself may not be significant, but may become significant when added to existing and reasonably foreseeable impacts eventuating from similar or diverse activities.</p>		
<p>Residual Risks: “Residual Risk”, means the risk that will remain after all the recommended measures have been undertaken to mitigate the impact associated with the activity</p>		

APPENDIX C – SPECIALISTS CURRICULUM VITAE

CRAIG SHOLTO-DOUGLAS

Date of Birth: 16-02-1989

QUALIFICATIONS

2014 – **M.Sc.** Environmental Science (Rhodes University – *on going*)

2013 – **B.Sc. Honours** Environmental Science (Rhodes University)

2012 – **B.Sc.** Zoology & Environmental Science (Rhodes University)

PROFESSIONAL EXPERIENCE

May 2017 – present:

Research technician/ecologist (&Beyond Phinda Private Game Reserve)

January 2015 – April 2017:

Environmental Consultant and Ecological Specialist (EOH Coastal & Environmental Services)

January 2013 – August 2014:

Restoration Ecologist and Project Research Technician (Rhodes Restoration Research Group – R3G)

January 2012 – November 2014:

Graduate Assistant (Rhodes University, Department of Environmental Science)

LEADERSHIP POSITIONS

Project facilitator and technician - Subtropical Thicket Restoration Project (STRP), in partnership with the Department of Environmental Affairs.

Project manager - Numerous Environmental Impact Assessments (EIAs), Basic Assessments (BAs), and Ecological Specialist Studies.

Assistant facilitator - Thicket Forum, Rhodes Restoration Research Group, Grahamstown, South Africa.

Excursion officer - WildREACH community outreach project.

College Prefect and Head of House – Diocesan College (Bishops).

ACADEMIC RESEARCH EXPERIENCE

I have been involved in a number of field and laboratory-based research projects involving both fauna and flora. Research projects include:

- A population census of leopard (*Panthera pardus*) at Kwandwe Private Game Reserve, Eastern Cape, South Africa.
- Monitoring of large terrestrial mammals at Kwandwe Private Game Reserve, Eastern Cape, South Africa.
- The effects of indigenous invasive plant species on species richness, Grahamstown, Eastern Cape, South Africa.

- Factors influencing survivorship of *Portulacaria afra* (spekboom) cuttings, in attempts to restore degraded lands in the Greater Addo Elephant National Park, Eastern Cape, South Africa.
- Vertebrate road count surveys and population estimates, Great Fish River Nature Reserve, Eastern Cape, South Africa.
- Carbon and biodiversity baseline assessments of the Greater Addo Elephant National Park, Eastern Cape, South Africa.

SELECTED CONSULTING EXPERIENCE:

I have conducted, assisted or worked on the following projects:

Ecological Specialist Studies:

Mozambique

- Faunal Specialist Study (lead avifaunal specialist), Metals of Africa, Cabo Delgado. Mozambique.
- Faunal Specialist Study, Kenmare Minerals, Moma, Nampula.
- Ecological Study, Kenmare Minerals, Pilivili, Nampula.
- Ecological Study, Baobab Iron Ore, Tete.
- Faunal Specialist Study, Triton Minerals, Ancuabe.

Western Cape, South Africa

- Avifaunal Impact Assessment (lead specialist), Department of Environmental Affairs, Quoin Point Environmental Impact Assessment.
- Faunal Impact Assessment (lead specialist), Eskom 50km Powerline from Mossel Bay to George.
- Faunal Impact Assessment (lead specialist), Eskom 400km Powerline from George to Beaufort West.

Eastern Cape, South Africa

- Bat Monitoring Specialist (lead specialist), Waainek Wind Energy Facility.
- Bird Monitoring Specialist (lead specialist), Waainek Wind Energy Facility.
- Ecological Assessment, Ukomeleza Wind Energy Facility.
- Faunal Scoping Report, PPC Mining Port Elizabeth.
- Faunal Specialist Study, Uhambiso Glen Hurd Road Upgrade.
- Ecological Impact Assessment (lead specialist), Albany Wind Energy Facility.
- Ecological Impact Assessment, Kariega River Causeway.
- Ecological Ground-truthing, Nxuba Wind Energy Facility.
- SMEC Environmental Status Report Ecological Survey.
- Ecological Impact Assessment, Fairewood Estate.

Geographic Information System (GIS) Mapping:

- Mapping for a number of projects across a variety of sectors using both QGIS and ArcGIS (renewable energy, mining, national parks and private reserves, estates, etc.)
- Vegetation type mapping for a number of projects in Mozambique and South Africa.
- Habitat sensitivity mapping for numerous projects.
- Wetland delineation mapping for numerous projects in Mozambique and South Africa.
- Relocation Action Plan Mapping for Social Impact Assessments in Mozambique.
- River and watercourses mapping for a number of Water Use License Applications.

Other relevant experience:

Environmental and Social Management Plans (EMPs)

- Baobab Iron Ore Environmental and Social Management Plan, Tete, Mozambique.
- Fairewood Estate Development Environmental Management Plan, Grahamstown, Eastern Cape, South Africa.
- InnoWind Waainek Wind Energy Project Environmental Management Plan, Grahamstown, Eastern Cape, South Africa.
- Aurecon Beach Drilling Port Alfred Environmental Management Plan, Port Alfred, Eastern Cape, South Africa.

Environmental Impact Assessments (EIAs) and Basic Assessment (BAs):

- SEDA Prospecting Right Application Basic Assessment, Queenstown, Eastern Cape, South Africa.
- ACSA OR Tambo Internal Airport Filling Station Basic Assessment, Johannesburg, South Africa.
- Fishwater Flats Wastewater Treatment Works Environmental Impact Assessment, Port Elizabeth, South Africa.
- Triton Minerals Ancube Environmental and Social Impact Assessment, Cabo Delgado, Mozambique.
- PRDW Power Barge Environmental Impact Assessment, Port Elizabeth, Eastern Cape, South Africa.

Environmental Control Officer (ECO):

- InnoWind Waainek Wind Energy Project ECO, Grahamstown, Eastern Cape, South Africa.
- Aurecon Pipeline Project ECO, Alexandria and Cannon Rocks, Eastern Cape, South Africa.
- Aurecon Water Treatment Works Project ECO, Port Alfred, Eastern Cape, South Africa.
- Aurecon Beach Drilling Project ECO, Port Alfred, Eastern Cape, South Africa.
- TNPA Vulindlela Site Remediation ECO, Port Elizabeth, Eastern Cape, South Africa.

COURSES

- Community-Based Natural Resource Management (2012), Rhodes University, Grahamstown, South Africa.
- Urban Forestry and Greening (2012), Rhodes University, Grahamstown, South Africa.
- Environmental Impact Assessment (EIA) Short Course (2012), Rhodes University and CES, Grahamstown, South Africa.
- Arid Zone Ecology & Thicket Fusion Forum (2012), Rhodes University, Eastern Cape, South Africa.
- Geographic Information System (GIS) Short Course (2015), Rhodes University, Grahamstown, South Africa.

MEMBERSHIPS

South African Bat Assessors Association (SABAA)
Zoological Society of Southern Africa (ZSSA)
Animal Demographic Unit

TARRYN MARTIN (M.Sc)

Date of Birth: 17-11-1982

QUALIFICATIONS

- M.Sc Botany with distinction (Rhodes University)
- B.Sc Hons. African Vertebrate Biodiversity (Rhodes University)
- B.Sc Botany and Zoology (Rhodes University)

COURSES

2012 – EIA Short Course, Rhodes University and CES, Grahamstown

MEMBERSHIP

- South African Council of Natural Scientific Professions (SACNASP). Registered as a Professional Natural Scientist (400018/14).
- Member of the South African Association of Botanists (SAAB)
- Member of the Botanical Society
- Member of Golden Key International Honour Society

THESIS

Photosynthetic and evolutionary determinants of the response of selected C₃ and C₄ (NADP-ME) grasses to fire.

AWARDS AND NOTABLE ACHIEVEMENTS

2011 - Junior Captain Scott-Medal (Plant Science) for producing the top MSc of 2010 from the South African Academy of Science and Art

2010 - Award for Outstanding Academic Achievement in Range and Forage Science from the Grassland Society of Southern Africa

SELECTED PUBLICATIONS

Taylor, S.; Ripley, B.S.; Martin, T.; De Wet, L-A.; Woodward, F.I.; Osborne, C.P. 2014. Physiological advantages of C₄ grasses in the field: a comparative experiment demonstrating the importance of drought. *Global Change Biology*. 20 (6): 1992-2003.

Ripley, B; Donald, G; Osborne, C; Abraham, T and Martin, T. (2010). Experimental investigation of fire ecology in the C₃ and C₄ subspecies of *Alloteropsis semialata*. *Journal of Ecology*. 98 (5): 1196 - 1203

South African Association of Botanists (SAAB) conference, Grahamstown.
January 2010 Title: Responses of C₃ and C₄ Panicoid and non-Panicoid grasses to fire.

South African Association of Botanists (SAAB) conference, Drakensberg.
January 2008. Title: Photosynthetic and Evolutionary determinants of the response of selected C₃ and C₄ (NADP-ME) grasses to fire.

PROFESSIONAL EXPERIENCE

May 2012 – Present: Environmental Consultant and Botanical Specialist (Coastal and Environmental Services, Grahamstown). Duties include conducting botanical and ecological assessments for local and international EIAs in southern Africa, identifying and mapping vegetation communities and sensitive areas, designing and implementing monitoring plans, designing rehabilitation and biodiversity offset plans, managing project budgets, coordinating specialists and site visits.

October 2011 – January 2012: Accounts Manager (Green Route DMC, Cape Town). Duties included project and staff co-ordination, managing large budgets for incentive and conference groups travelling to southern Africa, creating tailor-made programs for clients, negotiating rates with vendors and assisting with the ground management of inbound groups to ensure client satisfaction.

April 2011 – September 2011: Camp Administrator and Project Co-ordinator (Windsor Mountain International Summer Camp, New Hampshire, USA). Co-ordinated staff and camper travel arrangements, coordinated main camp events, assisted with marketing the camp to prospective families.

October 2010 – April 2011: Freelance Project Manager (Green Route DMC, Cape Town). Duties included project and staff co-ordination, managing large budgets for incentive and conference groups travelling to southern Africa, creating tailor-made programs for clients, negotiating rates with vendors and assisting with the ground management of inbound groups to ensure client satisfaction.

June 2010 – October 2010: Camp Counselor (Windsor Mountain International Summer Camp, New Hampshire, USA)

April 2009 – May 2010: NERC Research Assistant (Botany Department, Rhodes University, Grahamstown in collaboration with Sheffield University, Sheffield, England). Set up and maintained experiments within a common garden plot experiment, collected, collated and entered data, assisted with the analysis of the data and writing of journal articles.

March 2007 – October 2008: Head Demonstrator (Botany Department, Rhodes University, Grahamstown).

September 2005 – February 2007: Operations Assistant (Green Route DMC, Cape Town). Project co-ordination.

CONSULTING EXPERIENCE

Environmental consulting experience as project manager or team member is broad and covers a number of key areas. Specific experience includes the following:

Forestry Projects

- Lurio Green Resources Plantation Project Botanical Assessment, Vegetation and Sensitivity Mapping, Specialist Co-ordination, Nampula Province, Mozambique.
- Lurio Green Resources Wood Chip Mill and Medium Density Fibre-board Plant, Nampula Province, Project Manager and Ecological Specialist.

Mining Projects

- Toliara Mineral Sands Rehabilitation and Offset Strategy Report, Madagascar (2012)
- Syrah Resources Ecological Assessment, Cabo Delgado, Mozambique (2013)
- Baobab Mining Ecological Assessment, Tete, Mozambique (2013-2014)

- Triton Minerals Nicanda Hill Ecological Assessment and Project Manager, Cabo Delgado, Mozambique (2015 – present)
- Triton Minerals Ancuabe Ecological Assessment, Cabo Delgado, Mozambique (2015 – present)
- Nhangonzo Coastal Stream Critical Habitat Biodiversity Assessment, Inhassora, Mozambique (2015 - present).

Ecological Monitoring Projects

- Kenmare Terrestrial Monitoring Program Project Manager and Specialist Survey, MOMA, Mozambique (2012 – present)

Ecological Baseline Surveys

- LHDA Botanical Survey and Impact Assessment, Lesotho (2013-2014)
- iGas Saldanha to Ankerlig Biodiversity Assessment Project Manager (2015-present)

Renewable Energy Projects

- Dassiesridge Wind Energy Facility Project Manager, Eastern Cape, South Africa (2013 – present)
- Tsitsikamma Wind Energy Facility Community Power Line Ecological Assessment, Eastern Cape, South Africa (2012)
- Golden Valley Wind Energy Facility Power Line Ecological Assessment, Eastern Cape, South Africa (2012)
- Middleton Wind Energy Facility Ecological Assessment and Project Management, Eastern Cape, South Africa (2012)
- Mossel Bay Power Line Ecological Assessment, Western Cape, South Africa (2012)
- Biotherm Solar Voltaic Ecological Assessment, Zambia (2014)
- Savannah Nxuba Wind Energy Facility Powerline Ecological Assessment, ground trothing and permit applications (2015).

Ecological Groundtruthing Projects

- Harvestvale botanical groundtruthing assessment, Eastern Cape, South Africa (2013)
- Groundtruthing the turbine sites for the Waainek Wind Energy Facility, Eastern Cape, South Africa (2012)
- Cob Bay botanical groundtruthing assessment, Eastern Cape, South Africa (2014)

Due Diligence

- Solar Capitol Solar Photovoltaic Energy Facility Environmental and Social Compliance Monitoring Project Manager, Northern Cape, South Africa (2014)

Michael JAMES CAMPBELL BAILEY

Date of Birth: 28th June 1961

QUALIFICATIONS

- **M.Sc.** Quantitative Conservation Biology (University of the Witwatersrand, Johannesburg, South Africa)
- **B.Sc. (Hons.)** Biology and Ecology (University of Ulster, N.Ireland)

PROFESSIONAL MEMBERSHIP

Chartered Institute of Ecology and Environmental Management (CIEEM). Full Member since 2007

COURSES

2012 – Environmental Impact Assessment (EIA) Short Course, Rhodes University and CES, Grahamstown

PROFESSIONAL EXPERIENCE

July 2012 – Current: Principal Environmental Consultant (Coastal & Environmental Services, (EOH CES), Grahamstown, South Africa).

September 2011 – May 2012: Private Ecology Consultant (Cork, Ireland)

August 2009 – September 2011: Ireland Manager & Senior Ecologist (ADAS UK Ltd., Dublin, Ireland)

August 2007 – July 2009: Regional Ecologist (ADAS UK Ltd, Oxford, UK)

November 2006 – July 2007: International Manager (Ovelle Ltd, Ireland)

August 2003 – October 2006: Principal Ecologist/Project Manager (Trinity College Dublin, Ireland)

March 1999 – February 2004: Director (Savannah Trails Exclusive Safaris, Luangwa Valley, Zambia)

March 1996 – February 1999: Safari Manager/Senior Safari Guide (Norman Carr Safaris, Luangwa Valley, Zambia)

March 1995 – Feb 1996: Field Biologist, Bangweulu Swamps (WWF Zambia, Luapula Province, Zambia).

October 1992 – October 1994: Scientific Field Officer, Geology and Biology Departments, University of the Witwatersrand, (part of research team on projects in Okavango Delta, Botswana, and Kruger National Park, South Africa).

September 1984 – September 1992: Research Scientist (Genetics Department, Queen's University, Belfast, N. Ireland).

May – August 1984: Scientific Research Officer (Hwange, Zimbabwe National Parks and Wildlife Service).

CONSULTING EXPERIENCE

Environmental consulting experience as project manager or team member is broad and covers a number of key areas. Specific experience includes the following:

Environmental Project Management

- Project Manager for IFC PS compliant ESHIA for a new dam for Olam International (Zambia) at the NCCL coffee plantation in Kasama District, Zambia. Also responsible for terrestrial fauna specialist studies.
- Project Manager overseeing Health Impact, Ground Water and Baseline Ecological Assessments for the refurbishment of a graphite mine in Cabo Delgado province, Mozambique for Graphit Kropfmühl (GK) GmbH, Germany.
- Project Manager for Zambeef (Zambia) Community Engagement & Biodiversity Management Plans – funded by DEG Germany. This project developed a Biodiversity Action Plan for Zambeef's Chiawa Farm in Lower Zambezi, and Stakeholder Engagement Plans (SEPs) for each of Zambeef's five farms around Zambia.
- Project Manager for the development of two solar PV sites (4MW each) in remote areas of eastern Zambia, Petauke and Mfuwe, on behalf of BioTherm Ltd, South Africa.
- Project manager of biological baseline survey and impact assessment for the development of the new Polihali Dam near Mokhotlong, on behalf of the Lesotho Highlands Development Authority (LHDA), Maseru, Lesotho.
- Project Manager for Rapid Site Selection process for determining potential resettlement sites in Palma, northern Mozambique for WorleyParsons (UK) and Anadarko (USA).
- Project manager for IFC PS compliant ESHIA for EcoFarm Organic Sugarcane development project, Chemba, northern Mozambique
- Co-manager on Wind Farm developments for InnoWind Ltd, Eastern Cape, South Africa.
- Project Manager and Principal Consultant; Designed and conducted national Otter survey for Irish Government (Department of the Environment, National Parks and Wildlife Service).

Ecological Impact Assessments and Pre-feasibility Surveys

- Biodiversity Specialist producing specialist reports for an IFC compliant ESHIA for the Bisie Tin Mine Project in North Kivu, DRC, on behalf of Alphamin Resources Corp.
- Faunal Specialist: ESIA for two IFC PS compliant solar PV development sites in eastern Zambia, Petauke and Mfuwe, on behalf of BioTherm Ltd, South Africa.
- Pre-ESHIA survey: full ecological and environmental description and assessment of potential resettlement areas at an oil and gas development near Palma, northern Mozambique; on behalf of WorleyParsons (UK) and Anadarko (USA).
- Ecology and Land Use Specialist for an IFC Performance Standard (PS) (World Bank) compliant ESIA on Palm Oil plantation on Buvuma Island, Lake Victoria, Uganda.
- Ecological assessments and faunal specialist for an IFC PS compliant ESIA at an iron ore mining site in Tete, Mozambique, on behalf of Baobab Resources, Western Australia.
- Ecological specialist for an IFC PS compliant ESHIA for a new organic sugar plantation and beef farm in Chemba, Mozambique following MICOA requirements.
- Ecology Specialist for an IFC PS compliant ESHIA on an Equatorial Palm Oil plantation re-development in Grand Bassa County, Liberia.
- Ecological assessments for various EDF & SSE wind energy developments in UK and Ireland as part of EIA reports.
- Ecological assessments for other renewable energy projects, e.g. MBT and anaerobic digestion plants in UK and Ireland as part of EIA reports.

- Pre-feasibility survey for wind turbines on Sundays River for InnoWind, Eastern Cape, South Africa.

Ecological Constraint Surveys

- Zambian Government compliant (ZEMA) Environmental Project Briefs (EPBs - scoping reports) for solar PV development sites in Zambia.
- Ecological Assessment of Rufunsa Game Management Area, Lower Zambezi, Zambia, to determine hunting and tourism potential.
- Identifying ecological constraints and ecological scoping for the utility companies in UK and Ireland including EDF Energy, SSE, Thames Water, United Utilities.

Ecological Monitoring and Reporting

- Bird and Bat Post-construction monitoring to EWT and Birdlife South Africa best practice standards for InnoWind Wind Ltd. at their Waainek Windfarm, Grahamstown, Eastern Cape
- Development of biodiversity, ecological and natural resource monitoring programmes as part of a Biodiversity Action Plan (BAP) for Chiawa Farm, Lower Zambezi on behalf of Zambeef Products Plc, Lusaka, Zambia.
- On-going ecological terrestrial monitoring of a heavy metals mine project, Kenmare, Nampula Province, Mozambique.
- Baseline ecological survey and biodiversity monitoring of a palm oil plantation, Equatorial Palm Oil, Liberia.
- Monitoring and counting (aerial and driven transects) of large mammals (elephant and hippopotamus) and crocodile numbers in South Luangwa National Park, Zambia for Zambian Wildlife Authority (ZAWA)
- Baseline survey of Otter populations In Ireland
- Bird population counts for WWF, Zambia in the Bangweulu Swamps Zambia.
- Ecological monitoring of projects through project lifecycle, and conducting watching briefs.
- Reporting to Competent Authorities on ecological compliance.
- Monitoring and assessing animal and bird populations before, during and after development projects, e.g. wind farm developments in UK and Ireland.
- Survey and monitoring of animal populations as part of on-going National Park management plans in Ireland, Zambia and Zimbabwe.

Ecological Mitigation and Planning

- Land rehabilitation plan for Kenmare heavy mineral mining project, Mozambique
- Designing mitigation strategies and biodiversity offsets for a palm oil plantation, Equatorial Palm Oil, Liberia.
- Designing mitigation strategies for development projects in UK and Ireland for housing development and renewable energy clients.
- Consulted and advised on the effects of flood prevention schemes on regional and urban Otter populations in Ireland.
- Conducted surveys on and designed mitigation for badgers living in railway embankments in Ireland and UK.
- Working closely with local UK and Irish wildlife groups designing and implementing Biodiversity Action Plans for terrestrial mammals, especially badgers and otters.

Environmental Auditing and Compliance

- Assessment of compliance with IFC Performance Standards 1, 5 and 6 for SilverStreet Capital LLC, UK with regard to a commercial farm in Malawi.
- Development of IFC compliant Biodiversity Action Plans for five beef and crop farms on behalf of Zambeef Products Plc, Zambia.
- Assessment of compliance with RSPO and HCV standards of a palm oil plantation, part of the Vegetable Oil Development Project, Buvuma Island, Lake Victoria, Uganda.
- Sustainability assessment and recommendations for EcoFarm, an organic sugar and beef farm in Chemba, Mozambique.
- IFC Performance Standards deviation assessment for Kalumbila Mining Ltd (First Quantum Mining) Sentinel Deposit copper mining project, North Western Province, Zambia.
- Assessment of compliance with RSPO and HCV standards of a palm oil plantation, Equatorial Palm Oil, Liberia.

Environmental Reviews

- As Principal Consultant and Project Manager, I have reviewed numerous environmental and ecological reports as part of the overall review and quality control process to ensure compliance with all national, international and lender requirements.

RESEARCH & TEACHING EXPERIENCE

I have been involved with a number of field-based and laboratory research projects involving the genetics and distribution of the Eurasian Otter (*Lutra lutra*) in Ireland and Europe. This research has been published in peer-reviewed journals and presented at international workshops on Otter conservation.

I conducted the National Otter Survey of Ireland in fulfillment of the Irish obligation to the EU Habitats Directive. I was responsible for designing and conducting the entire field-based survey including coordinating teams of Irish NPWS rangers who also participated in the survey. This work has been published by the Irish Government.

While based in Luangwa Valley, Zambia I conducted several aerial game counts, particularly for elephant, hippopotamus and crocodile, on behalf of Zambian Wildlife Authority (ZAWA) using fixed-wing aircraft, micro-lights and helicopters.

I have been involved in a number of field-based ecology research projects in the Kruger National Park, South Africa, (monitoring fire initiatives, SAFARI), Hwange National Park, Zimbabwe (part of the elephant culling research team) and in various Irish protected areas researching and monitoring otter and bird population numbers.

While working for Queen's University, Belfast, I was involved in extensive research into Multiple Sclerosis (MS) using advanced genetic investigative techniques; results were published in peer-reviewed journals.

DIRECTORSHIP

From 1999 to 2004, I was a Director of Savannah Trails Plc, Zambia, a safari business based in Lusaka and operating exclusive bush camps in the Luangwa Valley (Kakuli and Mchenja bush camps). I was responsible for the daily operation of the company as well as leading specialist walking safaris in the Luangwa Valley, often in conjunction with Norman Carr Safaris. I also managed and led specialist safaris (notably birding safaris) many other areas of Zambia including North Luangwa, Lower Zambezi, Kafue, West Lunga, and Kasanka National Parks and the Bangweulu Swamps.

During the closed season I was responsible for the business development of the company and participated in marketing events at the World Travel Market in London and promotional events in the USA to further the tourism industry in the country and promote Zambia as an environmentally conscience destination.

CERTIFICATION:

I, the undersigned, certify that to the best of my knowledge and belief, this CV correctly describes me, my qualifications, and my experience. I understand that any wilful misstatement described herein may lead to my disqualification or dismissal, if engaged.

A handwritten signature in black ink that reads "Michael Bailey". The signature is written in a cursive style with a large initial 'M' and a long, sweeping underline.
