## 1 EXECUTIVE SUMMARY

Baagi Environmental Consultancy appointed EkolInfo CC to facilitate the flora assessment concerning the Environmental Impact Assessment (EIA) for a proposed 400 ~~kw~~-kV power line, near Musina in the Limpopo Province. Willem de Frey, sole member and principal consultant of EkolInfo CC, completed the flora assessment. Willem de Frey is a registered scientific professional in the fields of ecological – and botanical science with more than 20 years' experience.

The fieldwork was done in May 2014, but due to changes in the corridor alternatives, the report was only finalised during April 2015.

Fifteen plots were surveyed using the Braun-Blanquet approach. Access was the main reason for only 15 of the 25 plots targeted being sampled, is due to the fact that most of the properties are fenced off with game fence and has locks on their gates.

The survey confirmed the presence of two continental and two regional vegetation units as indicated in the regional review. In addition to the presence of the small-scale vegetation units, the vegetation also reflected the change in terrain, which has an influence on the grazing behaviour of the livestock within the landscape.

Although the potential for threatened Red Data plants to occur is high, none was recorded during the survey, however one provincially and four nationally protected trees were recorded. They are: *Adansonia digitata* (Baobab), *Boscia albitrunca* (Shepard Tree), *Combretum imberbe* (Leadwood), *Sclerocarya birrea* (Marula). From the data collected during the survey, it was possible to determine that *Combretum imberbe* occurs localised, while *Boscia albitrunca* occurs widely. It was noted that very few young individuals (0 – 3 m in height) was present within the landscape.

Using terrain ruggedness, the number of water courses transected and Limpopo Provinces Conservation Plan, it was determined that alternative 2, 3B is the least sensitive and alternative 2, 2A the most sensitive from a flora perspective.

The impact assessment and Environmental Management Plan will be completed once the preferred corridor had been determined.

## 2 INTRODUCTION

Baagi Environmental Consultancy (Baagi EC) appointed EkolInfo CC to assist with the vegetation study for the proposed construction of 400 kVva power lines from the Nzhelele sub station to the south of Musina (Messina) in Limpopo Province to an unknown substation on the Zimbabwe/South Africa border, north of Musina

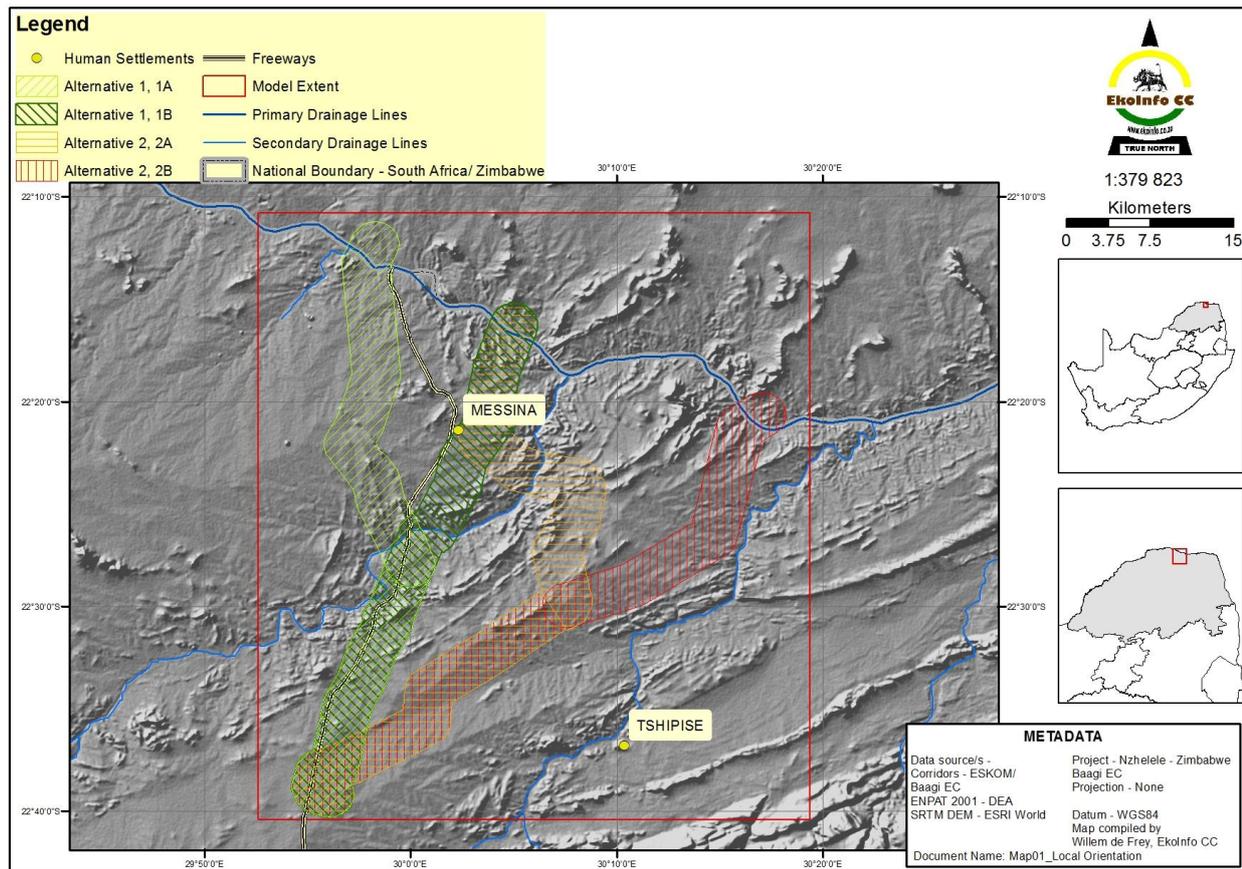

Figure 1(Figure-1).

### 2.1 Scope of work/ Terms of reference

Scope of work is based on emails received from Baagi EC and EkolInfo CC's experience of more than 20 years of facilitating vegetation studies with regards to Environmental Impact Assessment. In essence the study involves a regional overview of the vegetation communities and a local assessment of the species of concern. The aim of the regional overview is to flag the presence of threatened ecosystems, while the local assessment will flag and evaluate habitat for species of concern within the proposed corridors.

Based on the results of the regional and local assessment, the corridor which that has the least impact on the vegetation will be indicated. Expected impacts on vegetation within the preferred corridor will be listed and contributions made to a generic Environmental Management Plan (EMP).

## 3 METHOD STATEMENT

### 3.1 Regional Context

The regional context is obtained through a literature – and desktop review process, which involves the following data sources:

1. Scientific – and popular publications
2. Internet searches of government -, academic and research institution websites
  - a. Vegetation species information – provincial and topocadastral: <http://posa.sanbi.org/searchspp.php>
  - b. Red Data plants: <http://redlist.sanbi.org/>
3. Small scale spatial datasets
  - a. Geology – 1: 1 000 000 scale, source – Council for Geoscience
  - b. Climate – Weather Stations, source - SA Weather Bureau
  - c. Topography - Shuttle Radar Topography Mission digital elevation model (100 x 100 m pixels), source – ESRI World Data/ Glovis<sup>1</sup>
  - d. Soil – 1: 250 000 scale, source – Institute for Soil, Climate and Water
  - e. Regional vegetation (Vegmap) – 1: 250 000 scale, source - South African National Biodiversity Institute
  - f. Land cover – 1: 50 000 scale, source – Department of Environmental Affairs
  - g. National biodiversity priority layer – 1: 250 000 scale, source - South African National Biodiversity Institute
  - h. Limpopo Conservation Plan – 1: 50 000 scale, source - South African National Biodiversity Institute
  - i. Landsat 8 Satellite Imagery – 1: 50 000 scale (25 x 25 m pixels), source – Glovis
  - j. Topocadastral maps – 1: 50 000 scale (vector format), source – Surveyor - General

The above datasets were modelled and analysed using the following Geographic Information System software packages: Idrisi Selva, ESRI Arcview 10.1 and SAGA GIS. The main deliverables from the regional contexts are:

1. Flora sensitivity map
2. Least sensitive flora alignment
3. Least sensitive/ most suitable corridor from a floristic perspective

<sup>1</sup> <http://glovis.usgs.gov/>

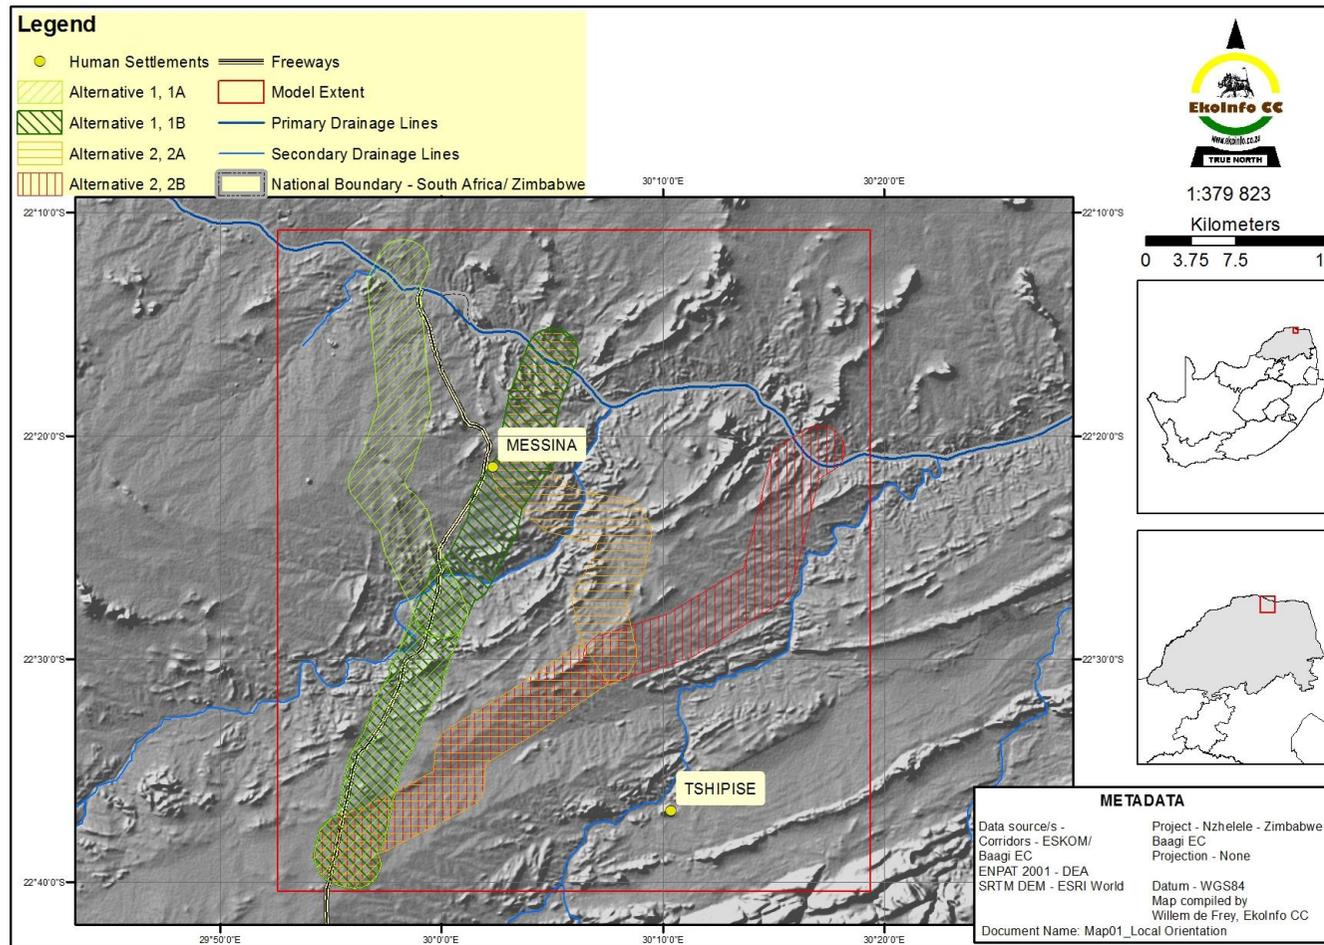

Figure 1: Regional orientation of the proposed power line corridors from Nzhelele substation to the Zimbabwe border, Limpopo South Africa

### 3.2 Local Context

The aim of the local context survey was to verify and refine the results from the regional context assessment. Fifteen (15) Braun-Blanquet surveys formed the basis of the assessment. These 15 plots were surveyed over a four-day period in May 2014 (Figure 2). In addition seven (7) protected tree plots were surveyed to determine the presence and extent of nationally and provincially protected species.

At the 15 Braun-Blanquet plots the following information was collected:

1. GENERAL INFORMATION

- a. Relevé number
- b. GPS coordinates (Decimal degrees, Datum WGS84)
- c. Date (yy/mm/dd)
- d. Surveyor
- e. Photo no
- f. Photo direction (Bearing)
- g. Notes

2. ENVIRONMENTAL DATA

- a. Altitude (m)
- b. Aspect (Bearing)
- c. Slope (%)
- d. Terrain unit
- e. Local topography
- f. Stratigraphy
- g. Petrology
- h. Lithology
- i. Soil form
- j. Termitaria present
- k. Cover Gravel
- l. Cover Small stones
- m. Cover Medium stones
- n. Cover Large stones
- o. Rock
- p. Soil depth (mm)
- q. Erosion categories
- r. Surface crusting
- s. Estimate % Clay (A - horizon)
- t. Cover open water (%)
- u. Cover bare rock (%)

3. VEGETATION CHARACTERISTICS

- a. Cover total (%)
- b. Cover tree layer (%)
- c. Cover shrub layer (%)
- d. Cover herb layer (%)
- e. Cover grass layer (%)
- f. Cover forbs layer (%)
- g. Height (highest) trees (m)
- h. Height lowest trees (m)
- i. Height (highest) shrubs (m)
- j. Height lowest shrubs (m)
- k. Aver height (high) herbs (cm)
- l. Aver height lowest herbs (cm)
- m. Maximum height herbs (cm)

A list of all species within an approximate 200m<sup>2</sup> area was recorded in the following growth form categories: grasses, forbs and woody species (shrubs and trees). Cover abundance values was estimated for each species within the sample plot. Unknown species or potential red data species was identified using field guides (Van Oudtshoorn 1991, Van Wyk & Malan 1988, Van Rooyen 2001, Van der Walt 2009), the University of Pretoria's herbarium and specialists from the National Botanical Institute.

A single team consisting of a professionally registered scientist in the fields of ecological – and botanical science and a field assistant facilitated the fieldwork.

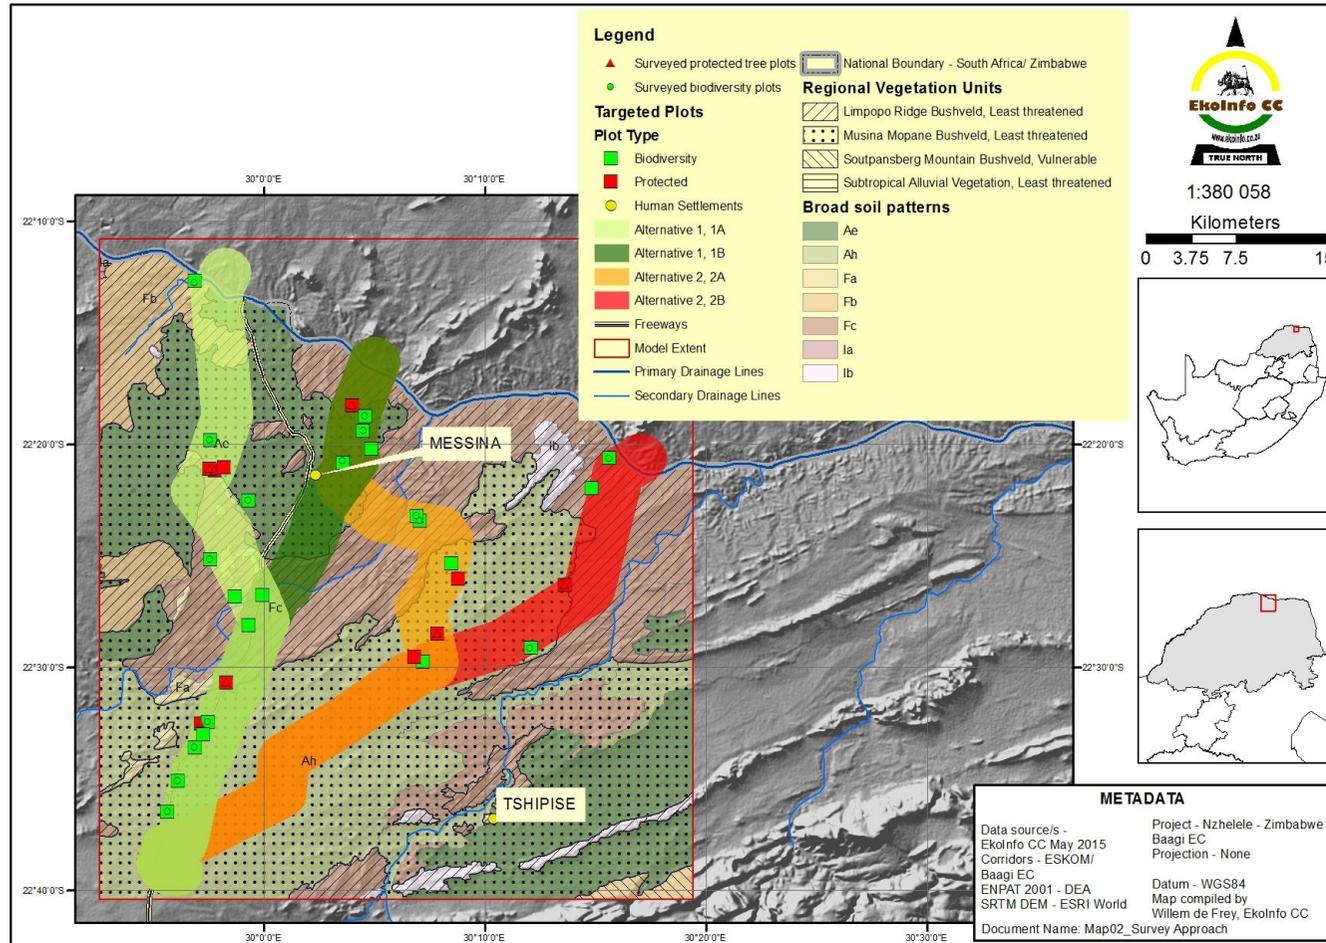

Figure 2: Overview of the distribution of the targeted and surveyed biodiversity and protected vegetation plots across the proposed corridor alternatives

The survey results were entered into a relational database for record purposes and analysis of the abiotic and vegetation characteristics. The species data was entered into TURBOVEG (Hennekens 1996) and analysed with Juice<sup>2</sup>. A vegetation map was compiled and refined, based on the results of the phytosociological table and boundaries of the homogenous units.

This approach follows the guidelines recommended for phytosociological studies on a national level with regards to the classification and description of vegetation in southern Africa (Brown *et al.* 2013).

The protected species plots focused on the protected trees and made use of variable plot sizes at the same location, all nationally and provincially protected trees present within a 25 x 25 m and 50 x 50 m area was recorded. The individuals present were recorded within the following height classes:

1. 0 – 3 m
2. 3 – 6 m
3. 6 m >

If none or less than five individuals of a protected species is recorded within the 25 x 25 m area (625 m<sup>2</sup>), then the survey is expanded into the next area (50 x 50 m = 2500 m<sup>2</sup>) up to a maximum of 10 individuals per protected species. The collected data was extrapolated to number of individuals per height class per hectare and number of individuals overall per species per hectare (10 000 m<sup>2</sup>).

The above information was used to refine the flora sensitivity model and guide the least environmental corridor assessment.

### 3.3 Limitations And Assumptions

1. It is assumed that all the information from third parties (government -, academic – and research institutions) is accurate.
2. Due to the presence of game fences and locked gates access was limited resulting in less plots sampled than originally targeted.
3. Due to the width of the corridor alternatives at 4 km each, the assessment is approached from a strategic perspective, as it is-was not practically possible to assess the whole area in detail within the available time and budget.
4. The main aim of the actual surveys was to assess the presence of ecological trends related to species of concern.

## 4 STUDY AREA

### 4.1 Alternative Corridors

The corridors concern actually two alternatives with two deviations each (Figure 1), namely:

1. Corridor 1 with deviations:
  - a. 1A
  - b. 1B
2. Corridor 2 with deviations:
  - a. 2A
  - b. 2B

Table 1 provides an overview of the two alternatives and their associated deviations in terms of surface area and distance, from this information it is evident that alternative 1, 1B is the shortest at 50 km, and alternative 2, 2A is the longest at 64 km. As would be expected the longest corridor at a width of 4 km covers the largest extent 25 510 ha (Table 1).

It should however be realised that each section of an alternative cannot be assessed in isolation, and therefore each alternative with its associated deviation will be assessed as single entity, which implies that there is effectively four corridor alternatives to be assessed.

<sup>2</sup> <http://www.sci.muni.cz/botany/juice/>

**Table 1: Overview of the surface area and distance associated with each alternative and associated deviation**

Alternative	Surface Area (Ha)	Units (m)			Length (km)
		Area	Length	Width	
1, 1A	22 855	228 545 036	57 136	4 000	57
1, 1B	20 133	201 325 538	50 331	4 000	50
2, 2A	25 510	255 098 516	63 775	4 000	64
2, 2B	23 442	234 423 075	58 606	4 000	59

DRAFT

## 4.2 Environmental Overview

The scoping document concerning the ecology of the project (Niemand 2014), highlighted the importance of the geology on influencing the distribution of vegetation, and evaluated the various corridors in terms of the regional vegetation units which these corridors transects. The scoping document also provides information on the land cover (human influences) associated with these corridors, as well as the distribution of protected areas (conservation priority areas) and therefore will not be repeated in this document. Table 2 however does provide an overview of the ecological drivers ~~which that~~ influence the distribution of vegetation on a regional and a local scale within the model extent area (Figure 1), as well as the areas of conservation priority in the area.

**Table 2: Overview of the ecological drivers and conservation priority areas ~~which that~~ influence vegetation distribution on a regional and local scale**

Ecological Drivers & Conservation Significance	Model Extent – 251 512 ha
Geology – 1: 1 000 000 scale	Gneiss, Quartzite, Pelite (26%)
Climate Zone – 1: 1 000 000 and smaller	Northern Transvaal; Hot Steppe with Summer rainfall; (BShw mainly) (100%)
Rainfall – Quaternary catchments	Range: 288 – 621 mm, mode: 305 mm & 333 mm (90%)
Altitude range	387 – 909 metre above mean sea level, mean – 548 m.a.m.s.l
Soil pattern – 1: 250 000 scale (Figure 2)	Ah (33%) – red and yellow, well drained soils with high base status
Regional vegetation – 1: 250 000 scale (Figure 2)	Musina Mopane Bushveld, Least threatened – 62%
Land Cover 2000 Cover (Human influences)	Thicket, Bushland, Bush Clumps, High Fynbos – 47%
National Biodiversity Priority Areas (Figure 3)	High – Legally protected areas > 40%, mode: high biodiversity – 27%
Limpopo Province Conservation Priority Areas – Version 2, 2013 (Figure 4)	Conservation Priority Areas Cover – 65%, mode: Critical Biodiversity Area 2 – 26%

From the overview in Table 2, it is evident that the landscape associated with the alternative corridors are diverse, with low human influence (Table 3) and large areas of conservation priority on both national (Table 4) and provincial level (Table 5).

Therefore it would be difficult for the proposed corridor alternatives to avoid areas of conservation concern.

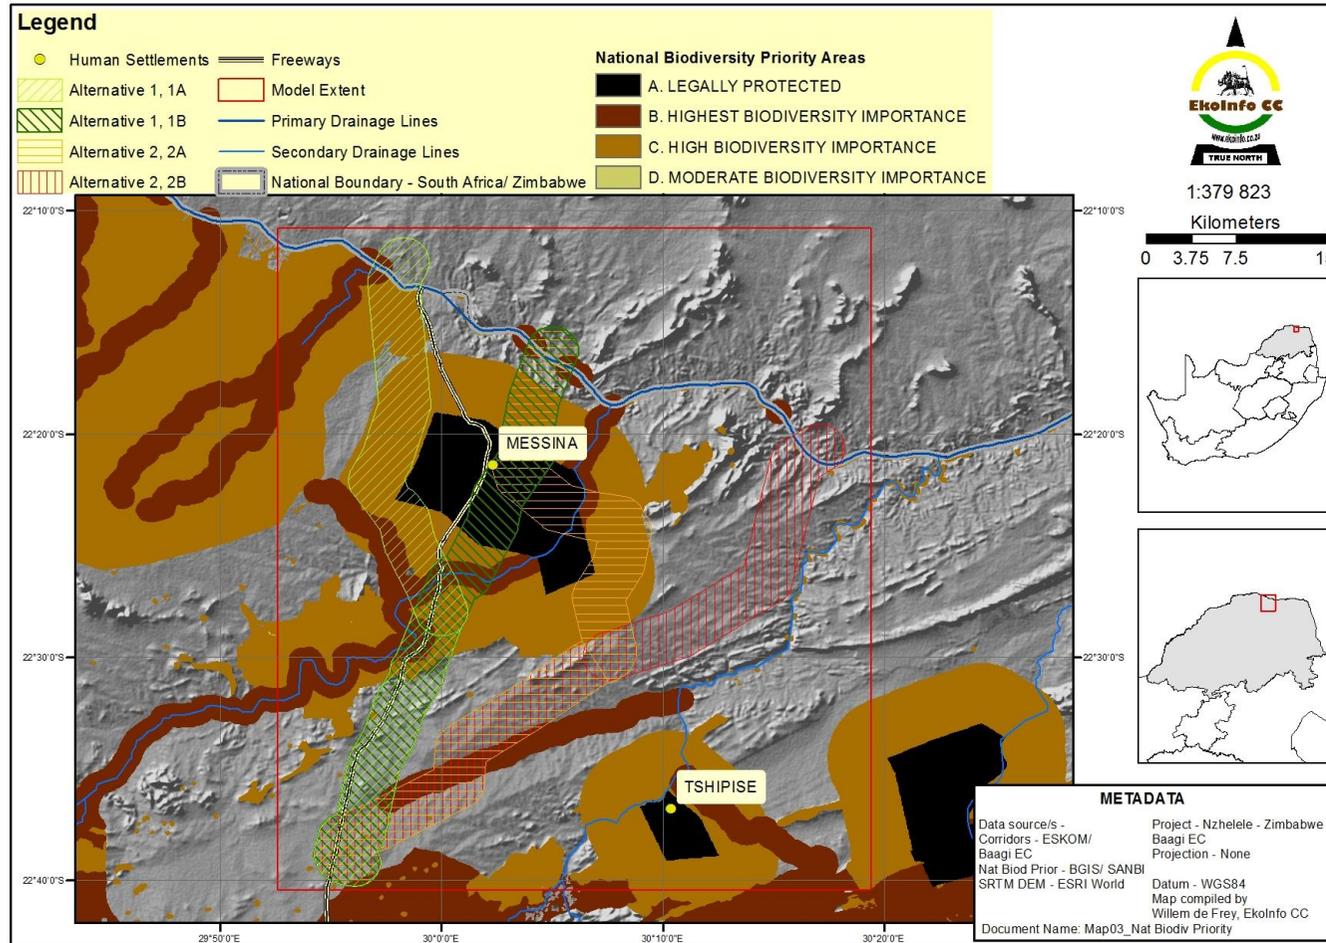

Figure 3: Overview of the distribution and extent of national biodiversity priority areas within the landscape associated with the alternative corridors

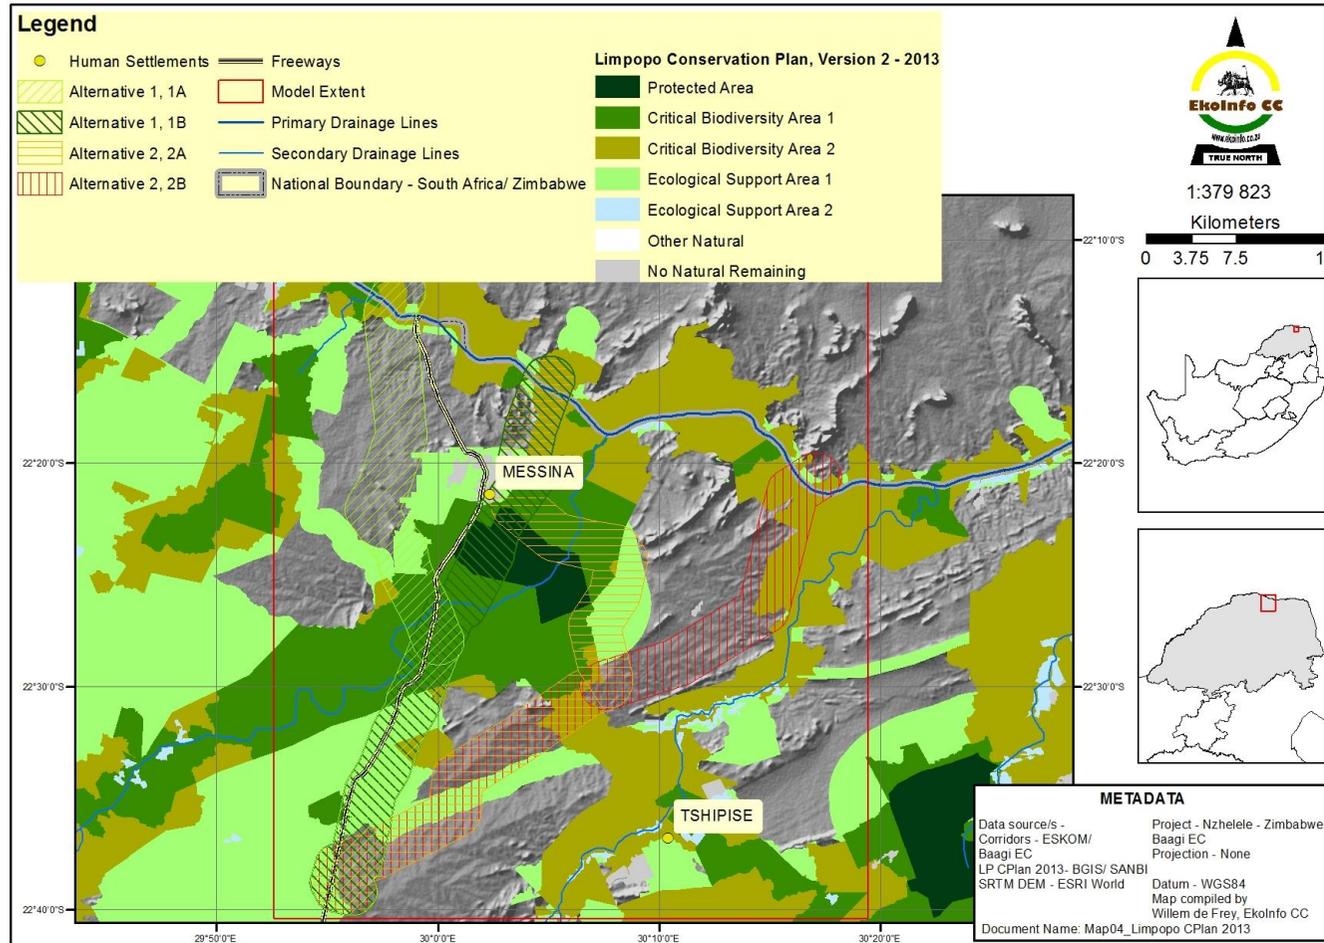

Figure 4: Overview of the distribution and extent of the provincial conservation priority areas within the landscape associated with the alternative corridors

Table 3: Overview of the land cover 2000 categories present within the landscape (model extent) associated with the alternative corridors

Land Cover 2000 categories	Surface Area (ha)	% Cover	Ecological Status	
			Natural	Transformed

			65%	35%

## 5 RESULTS

The results aim to evaluate the two aspects indicated in the National Environmental Management Biodiversity Act (No 10 of 2004), namely: ecosystem and species on both a regional (model extent) level and local level (within the alternative corridors) (Figure 1).

### 5.1 Regional Context

The regional context is defined by the model extent, which represents the landscape associated with the proposed alternative corridors. It covers an area of 251 512 ha (Table 2), which represents 25 times the minimum extent (10 000 ha) for an area to be evaluated on a landscape level (Turner *et al.* 2001, Wiens *et al.* 2006).

Formatted: Font color: Auto

#### 5.1.1 Ecosystem Diversity

Due to the nature of the project, which involves power distribution across international boundaries, the ecosystem diversity is presented from both a global/ continental and national perspective.

##### 5.1.1.1 Global/ Continental Perspective

From Figure 5, it can be observed that two global ecoregions (are associated with the area which the alternative corridors transect namely:

1. Southern Africa bushveld
2. Zambezian and Mopane woodlands
3. Drakensberg montane grasslands, woodlands and forests

The Southern Africa bushveld covers the largest portion, mainly to the south, while the Zambezian and Mopane woodlands covers the northern section and stretches in to Zimbabwe.

The Southern Africa bushveld<sup>3</sup> is described and summarised as follows:

"The Southern African Bushveld is part of the vast savannas that cover much of southern Africa. There is little in the way of endemic flora or fauna, but the charismatic large mammals and rich bird life typical of African savannas are present. The rugged Waterberg Mountains contain the highest levels of species richness and endemism in the region, and are noted for their reptile endemism. Cattle ranching and urban expansion from the nearby Pretoria-Witwatersrand-Vereeniging complex are the major threats to the conservation of this ecoregion. However, ecotourism has become a major land-use activity in the bushveld and has led to the establishment of many small nature reserves and private game parks in the area, which enhance the conservation status of this ecoregion."

This ecoregion is classified as Vulnerable.

#### "Types and Severity of Threats

The major land-use activities in the northern Province of South Africa are game and cattle farming. Game farming preserves the natural habitat whereas cattle farming can lead to its degradation. Cattle directly degrade the habitat by grazing and trampling plants and by exposing and compacting the soil, leading to soil erosion. Cattle can also lead to bush encroachment by reducing grass cover and subsequent fire frequency. These processes lead to reduced biodiversity within the area. The predatory and scavenging fauna of the bushveld are perceived as pests by farmers and routinely exterminated. Blackbacked jackals (*Canis mesomelas*), caracals (*Felis caracal*), and vulnerable Cape vultures (*Gyps coprotheres*) (Hilton-Taylor 2000) are common target species. Poisoned carcasses are a popular method of killing these species. Non-target species such as bat-eared foxes (*Otocyon megalotis*), aardwolves (*Proteles cristatus*), and aardvarks (*Oryzomys afer*) are often also killed....

Comment [Author1]: You provide 3 in the list below. Is that correct?

Southern Africa bushveld	160 893	64%
Zambeian and Mopane woodlands	68 552	27%
<b>Grand Total</b>	<b>251 479</b>	<b>100%</b>

DRAFT

There are fewer threats to the north of the ecoregion in Botswana and Zimbabwe, where low-intensity goat and cattle farming create the major impact. The removal of dead wood for firewood may also negatively impact obligate tree-hole nesting birds and small mammals (du Plessis 1995). In large areas of Botswana and Zimbabwe, wildlife contributes significantly to the local economy. Wildlife utilization was originally mostly licensed trophy hunting, but is now increasingly oriented toward non-consumptive recreation and tourism. This trend should improve the conservation status in the north of the ecoregion...

The Zambebian and Mopane woodlands<sup>4</sup> is described and summarised as follows:

“Zambebian and Mopane Woodlands are dispersed throughout southern Africa, bounded by the Luangwa River in the north and the Pongola River in the south. Mopane tree (*Colophospermum mopane*) woodlands mix with Zambebian woodlands in lower-elevation areas, often along major river valleys. Although the ecoregion, particularly the mopane communities, is considered to be poor in endemics, it supports some of the largest and most significant wildlife populations in Africa, particularly those of the endangered elephant (*Loxodonta africana*) and critically endangered black rhino (*Diceros bicornis*). Important populations of predators are also found in the Zambebian and Mopane Woodlands. The abundance of wildlife can be largely attributed to the high level of protection in the ecoregion, in which more than 45 percent of the habitat is devoted to various forms of state and private conservation. Two cross-border conservation efforts are set to further increase the extent of protected lands in the near future.”

This ecoregion is classified as Relatively Stable/Intact.

Types and Severity of Threats

The most widespread threat to the ecoregion is poaching and exploitation of wildlife (Stuart et al. 1990). Black rhino and wild dog are species of special concern. Black rhinos are still threatened by demands for rhino horn products and wild dogs are often destroyed by livestock farmers, who perceive them as pests (Stuart et al. 1990). In many areas of the ecoregion, poaching is rife due to poor levels of protection provided by understaffed local authorities, particularly in Zambia and Mozambique (IUCN 1992). However, great efforts have been made in the past few years to rejuvenate and expand many of Mozambique’s protected areas (The Peace Parks Foundation 2000a), so an improvement in the quality of wildlife protection is likely.

Land transformation and degradation through agriculture, settlement and livestock grazing poses some threat to the ecoregion, particularly in South Africa and Swaziland, where population densities are as high as 174 persons per km<sup>2</sup> (Els 1996) and large-scale agricultural plans have been introduced (Stalmans and Peel, 1999). In the near future, steadily growing populations (particularly those bordering Kruger National Park) could force the South African government to cede portions of the park and other protected areas to communities demanding space and resources (Els and Bothma 2000). The Zambezi Valley portion of the ecoregion in Mozambique may also be at risk from the steady influx of people and development as stability returns following the civil war. The cattle industry in Botswana threatens wildlife populations, as ranching activities supplant indigenous ungulates, destroy predators, and cattle and veterinary fences impede the movements of migratory mammals (Stuart et al. 1990). Illegal livestock grazing, settlement in protected areas, and uncontrolled bush fires are all threats to the ecoregion in Zambia (IUCN 1992), as well as the overuse of natural resources exacerbated by a declining economy (NESDA 2000). Another concern is the potential habitat destruction caused by uncontrolled elephant populations in some parts of the ecoregion, particularly in Botswana and Zambia (Stuart et al. 1990, IUCN 1992). Culling and translocations are used to regulate elephant populations within protected areas and research into immunocontraception has also been undertaken.

Invasive alien plants are posing an increasing threat to the ecoregion. Current data from the southeastern portion of the ecoregion show that alien plants cover 0.1 to 5 percent of the entire ecoregion in South Africa and Swaziland, with alien cover exceeding more than 20 percent in places (CSIR, undated). Among the more prolific invaders are the shrub and tree species *Lantana camara* and *Melia azederach*, cactii of the genus *Opuntia*, and the water weeds *Salvinia molesta* and *Eichornia crassipes*. Invasive plants are supplanting indigenous vegetation and

<sup>4</sup> <https://www.worldwildlife.org/ecoregions/at0725>

Comment [Author2]: Where does this quotation close?

Formatted: Superscript

destroying faunal habitats, as well as altering hydrological and nutrient cycles (CSIR, undated; IUCN 1997/1998).

The most immediate threat to the ecoregion is the present land invasion crisis in Zimbabwe, in which a large percentage of private farms have been occupied since the beginning of 2000. Zimbabwe's private conservation industry has been particularly affected, notably the large Save Valley and Chiredzi Conservancies in southeastern Zimbabwe near Gonarezhou National Park (Sharman 2000). The land invasions have coincided with a sharp increase in poaching, which have already caused huge losses to wildlife, as well as the application of slash-and-burn farming methods to areas unsuitable for agriculture, particularly in the mopane woodlands and scrub woodlands (Sharman 2000). Community conservation initiatives, such as the CAMPFIRE program, are also reported to have collapsed in the areas where land invasions have occurred (Sharman 2000)."

The Drakensberg montane grassland, woodlands and forest ecoregion is excluded from the discussion as it is located toward the southeast and unlikely to be influenced by the proposed activity.

On a continental scale, a standardised terrestrial ecosystems<sup>5</sup> map of Africa was compiled (Figure 6), of which eight units occur within the landscape associated with the alternative corridors, namely:

1. Zambesian *Cryptosepalum* Dry Forest
2. Southern African Scarp Forest
3. Limpopo Mopane
4. Zambezi Mopane
5. Wet Miombo
6. Dry Miombo
7. Sub-Escarpment Grassland
8. Lowveld-Limpopo Salt Pan

Of the eight units, the most dominant/ prominent units are the Limpopo Mopane and Zambezi Mopane (Table 7), which covers 82% and 14% respectively of the area.

The Limpopo Mopane unit is described as follows:

"This macrogroup is formed by the savanna communities occurring in the Limpopo province of South Africa and neighboring Zimbabwe, between 300 and 800 m elevation, on undulating to hilly plains with a variety of soils from deep clayey to deep sandy to shallow skeletal types of soils. The mean annual rainfall ranges from 300-550 mm and is strongly seasonal (summer). The vegetation varies from woodland to shrubland to more open savanna. Commonly the dominant species is *Colophospermum mopane*, but other dominants are *Combretum apiculatum*, *Terminalia prunioides*, *Terminalia sericea*, *Grewia flava*, *Acacia tortilis* ssp. *heteracantha*, *Acacia senegal* ssp. *leiorhachis*, *Acacia nigrescens*, *Adansonia digitata*, and *Sclerocarya birrea* ssp. *caffra*."

The Zambezi Mopane unit is described as follows:

"This type groups mopane-dominated and other open dry types of savanna occurring in the lowlands of southern Eastern Africa, south of the Central African Plateau. The altitudinal range is from 200 to 800 m and the mean annual precipitation is from 400-800 mm with few drier or wetter exceptions; the predominant rainfall regime is that of summer rainfall. The vegetation structure of the communities varies according to the soil types and the moisture availability, with dense and tall woodland types on alluvial soils to stunted shrublands on alkaline soils, and all the grades in between. Dominant species besides the mopane are *Albizia* spp., *Combretum* spp., *Adansonia digitata*, *Diospyros mespiliformis*, *Ficus sycomorus*, *Kigelia africana*, *Lonchocarpus capassa*, *Trichilia emetica*, *Xanthocercis zambesiaca*, and *Xeroderris stuhlmannii* in the north, and further south are *Acacia gerrardii*, *Acacia nigrescens*, *Acacia nilotica*, *Combretum apiculatum*, *Combretum collinum*, *Dichrostachys cinerea*, *Kirkia acuminata*, *Peltophorum africanum*, *Ptilostigma thonningii*, *Sclerocarya birrea*, and *Terminalia sericea*."

### 5.1.1.2 National Perspective

On a national scale, four regional units are present within the landscape associated with the alternative corridors (Figure 2), they are:

1. Limpopo Ridge Bushveld
2. Musina Mopane Bushveld
3. Soutpansberg Mountain Bushveld
4. Subtropical Alluvial Vegetation

These four regional vegetation units belong to two biomes, of which the most prominent is the Savanna Biome, which covers 99% (Table 8), of the three Savanna regional vegetation units, the Musina Mopane Bushveld covers 62% and the Limpopo Ridge Bushveld covers 37%. Both these two regional vegetation units' conservation status is least threatened. The only threatened regional vegetation unit is the Soutpansberg Mountain Bushveld, which is classified as Vulnerable and occurs in the southeastern corner, and therefore will not be influenced by the proposed corridor alternatives.

The Musina Mopane Bushveld is described as follows (Mucina & Rutherford 2006):

“Vegetation and landscape features

Undulating to very irregular plains, with some hills. In the western section, open woodland to moderately closed shrubveld dominated by *Colophospermum mopane* on clayey bottomlands and *Combretum apiculatum* on hills. In the eastern section on basalt, moderately closed to open shrubveld is dominated by *Colophospermum mopane* and *Terminalia prunoides*. On areas with deep sandy soils, moderately open savannah dominated by *Colophospermum mopane*, *T. sericea*, *Grewia flava* and *Combretum apiculatum*. Field layer well developed (especially on the basalt), open during the dry season, the herbaceous layer is poorly developed in areas with dense cover of *Colophospermum mopane* shrubs, for example, north of Alldays bordering the Limpopo floodplain.”

The following species were recorded as important taxa within this unit:

*Acacia nigrescens*, *Acacia senegal* var. *leiornhachis*, *Acacia tortilis* subsp. *heteracantha*, *Acalypha indica* var. *indica*, *Acrotome inflata*, *Adansonia digitata*, *Aptosimum lineare* var. *lineare*, *Aristida adscensionis*, *Aristida congesta* subsp. *congesta*, *Barleria senensis*, *Becium filamentosum*, *Boscia albitrunca*, *Boscia foetida* subsp. *rehmanniana*, *Bothriochloa insculpta*, *Brachiaria deflexa*, *Cenchrus ciliaris*, *Colophospermum mopane*, *Combretum apiculatum* subsp. *apiculatum*, *Commiphora glandulosa*, *Commiphora pyracanthoides*, *Commiphora tenuipetiolata*, *Commiphora viminea*, *Dicoma tomentosa*, *Digitaria eriantha*, *Enneapogon cenchroides*, *Eragrostis lehmanniana* var. *lehmanniana*, *Eragrostis pallens*, *Felicia clavipilosa* subsp. *transvaalensis*, *Fingerhuthia africana*, *Gardenia volkensii* subsp. *volkensii* var. *volkensii*, *Gossypium herbaceum* subsp. *africanum*, *Grewia bicolor* var. *bicolor*, *Grewia flava*, *Harpagophytum procumbens* subsp. *transvaalense*, *Heliotropium steudneri*, *Hermannia glanduligera*, *Hermbstaedtia odorata* var. *odorata*, *Heteropogon contortus*, *Hoodia currorii* subsp. *lugardii*, *Maerua parvifolia*, *Momordica balsamina*, *Neuracanthus africanus* var. *africanus*, *Oxygonum delagoense*, *Pechuel-Loeschea leubnitziae*, *Ptycholobium contortum*, *Rhigozum zambesiacum*, *Schmidtia pappophoroides*, *Sclerocarya birrea* subsp. *caffra*, *Seddera suffruticosa*, *Sesamothamnus lugardii*, *Sporobolus nitens*, *Stapelia gettliffei*, *Stapelia kwebensis*, *Sterculia rogersii*, *Stipagrostis hirtigluma* subsp. *patula*, *Stipagrostis uniplumis* var. *uniplumis*, *Tephrosia polystachya* var. *polystachya*, *Terminalia prunoides*, *Terminalia sericea*, *Tetrapogon tenellus*, *Urochloa mosambicensis*, *Ximenia americana* var. *microphylla*

“Conservation

Least Threatened. Target 19%. Only 2% staturorily conserved mainly in Mapungubwe National Park as well as in Nwanedi and Honnet Nature Reserves. Additionally, about 1% conserved in the Baobab Tree Reserve. Roughly 3% transformed, mainly by cultivation. Erosion is high to moderate.”

**Table 8: Overview of the biomes and regional vegetation units present within the landscape associated with the alternative corridors**

	99.3%	0.7%		

DRAFT

The Limpopo Ridge Bushveld is described as follows (Mucina & Rutherford 2006):

“Vegetation and landscape features

Extremely irregular plains with ridges and hills. Moderately open savannah with poorly developed ground layer. Umbrella-shape canopied *Kirkia acuminata* is prominent on some ridge skylines with the often enormous *Adansonia digitata* on shallow calcareous gravel; the shrub *Catophractes alexandri* is dominant on calc-silicate soils. These are particularly striking landscapes with rock walls and passages within areas of sandstone of the Clarens Formation (e.g. within the Mapungubwe National Park)”

The following species were recorded as important taxa within this unit:

*Acacia nigrescens*, *Acacia senegal* var. *leiorhachis*, *Acacia tortilis* subsp. *heteracantha*, *Adansonia digitata*, *Aristida adscensionis*, *Aristida stipitata* subsp. *stipitata*, *Barleria affinis*, *Blepharis diversispina*, *Boscia albitrunca*, *Catophractes alexandri*, *Cissus cornifolia*, *Colophospermum mopane*, *Combretum apiculatum* subsp. *apiculatum*, *Combretum imberbe*, *Commiphora gracilifrons*, *Commiphora mollis*, *Commiphora pyracanthoides*, *Commiphora tenuipetiolata*, *Digitaria eriantha*, *Enneapogon cenchroides*, *Ficus abutilifolia*, *Ficus tettensis*, *Gardenia resiniflua* subsp. *resiniflua*, *Grewia bicolor* var. *bicolor*, *Hibiscus calyphyllus*, *Hibiscus micranthus* var. *micranthus*, *Kirkia acuminata*, *Neuracanthus africanus* var. *africanus*, *Panicum maximum*, *Plinthus rehmannii*, *Ptycholobium contortum*, *Schmidtia pappophoroides*, *Sclerocarya birrea* subsp. *caffra*, *Sterculia rogersii*, *Stipagrostis uniplumis* var. *uniplumis*, *Tavaresia barklyi*, *Terminalia prunioides*, *Ximenia americana* var. *microphylla*. The following two species are endemic taxa: *Cleome oxyphylla* var. *oxyphylla*, *Pavonia dentata*.

“Conservation

Least threatened. Target 19%. Some 18% statutorily conserved, mainly in the Kruger and Mapungubwe National Parks. An additional 2% conserved in the Baobab Tree Reserve (thus together attaining the target). Only about 1% is transformed, mainly for cultivation and mining”

Therefore it is expected that any vegetation surveys within the study area would reflect the presence of these two regional vegetation units, of which neither is threatened.

### 5.1.2 Species Diversity

SANBI's POSA<sup>6</sup> database lists 4 799 flora species for the province, of which 71 species are classified as threatened (Vulnerable, Endangered, Critical Endangered) (Table 9). Appendix B contains the list of threatened Red Data flora for Limpopo Province as obtained from the POSA website on the 28<sup>th</sup> of April 2015. These 71 species represents 33 plant families and 52 genera.

Nine topocadastral maps are associated with the corridor alternatives (Figure 7), these nine topocadastral grids contain 742 species or 15% of all the species recorded within Limpopo Province. **No threatened Red Data plants had been recorded within these nine grids.**

In terms of provincially protected flora the following 26 species had been recorded in terms of the Limpopo Environmental Management Act (Act 7 of 2003) within the nine grids associated with the study area: *Adansonia digitata*, *Adenium multiflorum*, *Aloe globuligemma*, *Aloe littoralis*, *Aloe lutescens*, *Ansellia africana*, *Ceropegia ampliata*, *Combretum vendae*, *Cyrtorchis praetermissa*, *Eulophia angolensis*, *Eulophia hereroensis*, *Hermbstaedtia capitata*, *Hibiscus sabiensis*, *Huernia whitesloaneana*, *Huernia zebrina*, *Ochna glauca*, *Orbea lugardii*, *Orbea rogersii*, *Orbea valida*, *Orbea woodii*, *Peristrophe cliffordii*, *Phyllanthus pinnatus*, *Stapelia gettliffei*, *Stapelia kwebensis*, *Tavaresia barklyi*, *Tridactyle tricuspis*, *Xylopa parviflora* (Table 10). **It should be noted in certain cases all the species in the genus or family is protected.**

Three nationally protected flora in terms of the National Environmental Management Biodiversity Act (No 10 of 2004), they are: *Dioscorea sylvatica*, *Harpagophytum procumbens*, *Orbea woodii* (Table 11).

Aloe globuligemma	Aloe	All species in genus	
Aloe littoralis			
Aloe lutescens			
Ceropegia ampliata	Ceropegia		
Huernia whitesloaneana	Huernia		
Huernia zebrina			
Orbea lugardii	Orbea		
Orbea rogersii			
Orbea valida			
Orbea woodii			
Stapelia gettliffei	Stapelia		
Stapelia kwebensis			
Tavaresia barklyi	Tavaresia		
Ansellia africana	Orchidaceae		All species in family
Cyrtorchis praetermissa			
Eulophia angolensis			
Eulophia hereroensis			
Tridactyle tricuspis			

**Table 11: Overview of the three nationally protected species in terms of the National Environmental Management Biodiversity Act**

Botanical Name	Conservation Status - National
Dioscorea sylvatica	Vulnerable
Harpagophytum procumbens	Protected
Orbea woodii	Vulnerable

Within the nine topocadastral grids associated with the corridor alternatives, the following four trees which are protected in terms of the National Forest Act (No 84 of 1998), were recorded: *Adansonia digitata*, *Boscia albitrunca*, *Combretum imberbe* and *Philenoptera violacea*.

**Therefore it should be quite evident that there is a very high potential for either provincially or nationally protected flora to occur within the corridor alternatives.**

## 5.2 Local Context

This section is based on the results of the actual vegetation surveys using the Braun-Blanquet approach during May 2014.

### 5.2.1 Ecosystem Diversity

A two-way species indicator analysis (TWINSPAN) of the collected species data (Appendix C) and correlation with the recorded environmental data (Table 12), indicates the presences of two major units. These two major units are representative of the continental and regional vegetation units described within the regional context section, namely cluster one and two (TWINSPAN level 1) is associated with the Limpopo Mopane continental unit or Musina Mopane Bushveld regional vegetation unit and cluster three and four being associated with the Zambezi Mopane continental unit or Limpopo Ridge Bushveld regional vegetation unit (Figure 8).

The vegetation also reflect a grazing gradient (level of utilisation) based on the ruggedness of the terrain (Figure 9), with cluster one and two which is associated with the flat landscape, being more accessible to livestock, whether domestic or game, compared to cluster three and four which are associated with a steeper, more rugged landscape, which is less accessible to livestock. The presence (high constancy and abundance) of the following species in cluster one and two, support this statement: *Dicoma tomentosa* (Appendix C – Species Group A), *Acacia tortilis* (Species Group A), *Aristida congesta* (Species Group B), *Aristida rhiniochloa* (Species Group B), *Tragus berteronianus* (Species Group B), *Acacia erubescens* (Species Group B), *Aristida adscensionis* (Species Group G) and *Dichrostachys cinerea* (Species Group H), all of these species are associated with over utilisation of natural veld (Van Wyk & Van Wyk 1997, Van Oudtshoorn 1991). The following species in Species Group F are in contrast associated with well-managed or responsibly utilised veld: *Digitaria eriantha*, *Tricholaena monachne* and *Panicum maximum* (Van Oudtshoorn 1991)

Based on this information, it is evident that the corridor alternatives transects through vegetation dominated by *Colophospermum mopane* (Appendix C, Species Group H), followed by *Terminalia prunioides*, which confirms the dominance of the Musina Mopane Bushveld in this area.

### 5.2.2 Species Diversity

#### 5.2.2.1 Species Richness

During the survey, which involved 15 plots, 95 species (Appendix C) were recorded or 13% of the 742 species recorded within the nine topocadastral grids associated with the study area. On average 26 species were recorded per plot, while the minimum was 16 species and the maximum 37 species (Table 13).

Of the 95 species, 37 species or 39% are forbs, 22 species or 23% are grasses and 36 species or 38% are woody species (trees and shrubs) (Table 14).

#### 5.2.2.2 Threatened Red Data and Protected Plants

None of the potential 71 threatened Red Data plants listed for Limpopo Province were recorded within the plots surveyed, however this does not imply that some of the species could be present.

<b>Grand Total</b>	<b>95</b>	<b>100%</b>

The only provincially protected plant in terms of the Limpopo Environmental Management Act recorded within the plots surveyed was *Adansonia digitata* (Baobab).

The following nationally protected trees were recorded within the 15 plots surveyed, namely: *Adansonia digitata* (Baobab), *Boscia albitrunca* (Shepard Tree), *Combretum imberbe* (Leadwood), *Sclerocarya birrea* (Marula). From the Braun-Blanquet table (Appendix C), it is evident that *Combretum imberbe* occurs localised, mainly in close proximity to water-course, while the other three species are common throughout the area, *Adansonia digitata* being more prominent on or in the vicinity of outcrops/ ridges.

**It should be noted that a permit is required for the destruction of these species in terms of the National Forest Act.**

From the data in Table 15, it is possible to make the following observations with regards to these four nationally protected trees:

1. *Boscia albitrunca* is the most common protected tree in the area, and was present in all of the plots surveyed, it occurs at an average density of 18 individuals per hectare.
2. *Combretum imberbe* is the most localised protected species due to its association with water courses.
3. *Sclerocarya birrea subsp. caffra* is the second most abundant, and occurred in more than 50% of the plots sampled; it is present at an average density of 11 individuals per hectare.
4. *Adansonia digitata* is more localised than *Sclerocarya birrea subsp. caffra*, but less than *Combretum imberbe*, it occurs at an average density of 4-four individuals per hectare.
5. Overall it would appear as if there is not enough young individuals (0 – 3 m) within the protected tree populations, with the majority of the individuals being present in the 3 – 6 m class, and only a limited number of very large individuals, the exceptions are *Adansonia digitata* where there is equal numbers of young, middle age and old individuals and *Sclerocarya birrea subsp. caffra* where the very large (mature) individuals outnumber the middle age size class. The absence of young individual could be attributed to the over utilisation of the landscape by livestock, especially cattle or the absence of the relevant propagation agents, especially in areas where ecological process had been disrupted.

#### 5.2.2.3 Medicinal Plants

The following two species with medicinal properties were recorded within the 15 plots surveyed, namely: *Adansonia digitata* and *Sclerocarya birrea subsp. caffra* (Van Wyk, Van Oudtshoorn & Gericke 2000), both species occur widely throughout the study area.

#### 5.2.2.4 Alien invasive species

A single declared alien invasive species were recorded within the 15 plots surveyed, namely *Opuntia ficus-indica*, it is a Category 1 species in terms of the Conservation of Agricultural Resources Act (No 43 of 1985) and needs to be eradicated and controlled. The majority of the species belonging to the Cactacea family is considered to be a serious threat to the biodiversity in South Africa and needs to be controlled. In terms of the National Environmental Management Biodiversity Act, this species is classified as Category 1b and must be controlled via an invasive species management programme.

Table 15: Overview of the number of individuals per hectare of nationally protected trees based on seven plots

Nationally protected trees	Plot number							Grand Total	Density per ha – all height classes			% constancy

## 6 SENSITIVITY ANALYSIS

From the data collected and observations made during the survey in May 2014, as well as the information contained in the regional overview, it is evident that the corridor alternative transects a mainly intact landscape consisting of least threatened vegetation, but with provincial and national protected species throughout. However it was noted that certain protected trees tend to increase in number the more rugged the landscape become, which either correlates with the presence of ridges or the eroded landscape adjacent to water course. Therefore the terrain ruggedness index is considered to be a relevant surrogate for the evaluation of the sensitivity of the three corridor alternatives. It is expected that the more water-courses present in a corridor, the more likely it would be that it would impact on a protected tree such as *Combretum imberbe* (Leadwood), while it was noted that *Adansonia digitata* (Baobab) occurs at higher densities in more rugged terrain.

Based on this approach, corridor alternative 2, 2B is the least sensitive and corridor alternative 2, 2A the most sensitive (Table 16). If the number of water course transected by the corridor alternatives are considered then Alternative 2, 2B remains the least sensitive, but alternative 1, 1B becomes the most sensitive (Table 17). When the Limpopo Province conservation plan is used as a surrogate to assess the sensitivity of the corridors, then alternative 2, 2B is once again the least sensitive, with alternative 2, 2A being the most sensitive once again (Table 18).

If a weighted approach is applied using all three the surrogates, then alternative 2, 2B remains the least sensitive and alternative 2, 2A the most sensitive (Table 19).

Therefore from a floristic perspective, alternative 2, 2B should be considered for the construction of the power line, while alternative 2, 2A should be avoided.

## 10 APPENDIX A – ABRIDGE CV, PRINCIPLE CONSULTANT

Name of firm: EkolInfo cc Environmental and Wildlife Management Consultancy  
 Name of staff: WILLEM HENDRIK DE FREY  
 Profession: Environmental and Wildlife Management consultant  
 Years with firm: Since 1995  
 Nationality: RSA  
 Membership of professional societies:  
     The South African Council for Natural Scientific Professions (Reg no 400100/02)  
     Categories: Botanical Science and Ecological Science  
 Currently in the process of affiliating to:  
     South African Association of Botanist (SAAB)  
     Grassland Society of Southern Africa  
     South African Institute of Ecologist and Environmental Scientists (SAIE)

### KEY QUALIFICATIONS:

Mr W de Frey has been involved in the discipline of ecology since 1989. During this period he prepared himself for a profession in environmental and wildlife management, by attending courses in chemistry, geology, pedology and statistics, while majoring in Botany and Zoology. His working knowledge was obtained while completing projects for his post-graduate studies in wildlife management in both the Savanna and Grassland Biomes. In addition to his academic publications, he has contributed to numerous reports regarding EMPR's, EIA's, vegetation - and soil surveys and monitoring since the registration of his own consultation close corporation in 1995. He is actively involved in the management and marketing of his close corporation while completing tasks in his field of expertise namely soil, vegetation science and Geographical Information Systems. Mr W de Frey is task orientated with consideration of people's needs and safety. He believes in a holistic approach to environmental and wildlife management and has therefore established a network with individuals in related fields. He is also assisting previously disadvantaged persons in establishing a presence in the environmental industry, namely Lordwick Makhura of Baagi Environmental Consultancy CC and a joint venture company Bonolo Biodiversity And Environmental Management consisting of Baagi Environmental Consultancy CC and Disa Mphago Community Helpers CC.

### EDUCATION:

1992 BSc Botany & Zoology, University of Pretoria

Course	Content	Level
Chemistry	Organic and Inorganic chemistry	1 <sup>st</sup> year
Geology	Introduction/ Geomorphology, Stratigraphy, Structural, Sedimentology Palaeontology, Crystallography	1 <sup>st</sup> and 2 <sup>nd</sup> year
Pedology	Introduction, soil classification, soil fertility, soil ecology, soil physics	1 <sup>st</sup> and 2 <sup>nd</sup> year
Botany	Morphology, Anatomy, Physiology, Taxonomy, Mycology, Ecology, Reproductive biology	1 <sup>st</sup> , 2 <sup>nd</sup> and 3 <sup>rd</sup> year
Zoology	Taxonomy (Vertebrates and Invertebrates), Physiology (mainly vertebrates), Ecology (mainly vertebrates), Animal behaviour (mainly vertebrates)	1 <sup>st</sup> , 2 <sup>nd</sup> and 3 <sup>rd</sup> year
Statistics	Sampling methods, Statistical Analysis, Probabilities	1 <sup>st</sup> year

1993 BSc (Hons) (Cum laude) Wildlife Management, University of Pretoria  
 Dissertation: 'N HOLISTIESE EKOLOGIESE BENADERING TOT DIE DRAKRAGBEPALING VAN 'N GEMENGDE WILD- EN BEESBOERDERY IN DIE UBOMBO DISTRIK, MET ENKELE BESTUURS AANBEVELINGS, 1993

1999 MSc (Cum laude) Wildlife Management, University of Pretoria  
 Thesis: PHYTOSOCIOLOGY OF THE MPUMALANGA HIGH ALTITUDE GRASSLANDS, 1999

**COURSES/ WORKSHOPS ATTENDED**

1. Red List And Threatened Species Assessment Training Workshop, Hosted by the Conservation Breeding Specialist Group Southern Africa & Endangered Wildlife Trust, December 2003
2. National State of the Environment Workshop, Hosted by DEAT and SRK, ESKOM Convention Centre – November 2004
3. Gauteng Red Data Flora Workshop, Hosted by SANBI and GDACE – November 2005
4. Gauteng Flora Minimum Requirement Workshop, Hosted by GDACE Nature Conservation – August 2007

**EMPLOYMENT RECORD:**

1986 – 1987

5 Signals Regiment, SADF

1998 – 1993 – Partime

Council of Geoscience, Palaeontology Section

University of Pretoria, Botany Department

Academy of Marksmanship, Range Officer

U Huisoppasser, Own enterprise

1994 – 1995

University of Pretoria, Botany Department, Assistant researcher

1995 – present

EkolInfo cc Environmental and Wildlife Management Consultancy, Founding member and consultant

Overall EkolInfo CC's principal consultant completed or administrated more than 58 vegetation studies as part of Environmental Impact Assessments within all of South Africa's nine provinces and adjacent countries such as Botswana and Mozambique with a focus on either terrestrial vegetation and/ or wetlands. Some projects were on provincial level such as the Mpumalanga and Gauteng Degradation Projects coordinated by the Institute for Soil, Climate and Water and sponsored by National Department of Agriculture. The majority of projects were on local scale from 5 ha to 50 000 ha or more for local developers and corporate institutions (SASOL, Anglo Coal, BHP Billington, Ingwe Coal, Deneys Rietz Attorneys, ESKOM) facilitated independently or as a subcontractor/ specialist for the following institutions: Oryx Environmental CC, African EPA, Arcuss Gibb, Digby Wells and Associates, Nature and Business Alliance and Eyethu Engineers, Strategic Environmental Focus.

**COMMUNITY SERVICE**

1. Substitute lecture – 2nd & 3rd year Botany Practical (Vegetation Survey Methods), University of Pretoria -1994 & 1995
2. Guest lecture – Wetland Vegetation Communities (2nd year students), Department of Landscape Architecture, University of Pretoria – 1996 & 1997
3. Guest lecture – Principles of Ecology (1st year students), Department of Landscape Architecture, University of Pretoria – 2002
4. Guest lecture – Principles of vegetation survey and mapping for EIA's (3rd year students), Department of Landscape Architecture, University of Pretoria – 2003
5. Referee – ILASA Merits Awards (Environmental Planning), Institute for Landscape Architects of South Africa - 2003

**LANGUAGES:**

Language	Capability
English & Afrikaans	Speak, Read, Write - sufficient
Sepedi (Northern Sotho)	Speak, Read, Write – insufficient

## 11 APPENDIX B – LIST OF THREATENED RED DAT FLORA

Note: Red Data threatened categories: VU = Vulnerable, EN = Endangered, CR = Critical Endangered

Species	Threat status	SA Endemic	Lifecycle	Growth forms
VULNERABLE SPECIES (VU)				
<i>Barleria dolomiticola</i> M. & K. Balkwill	VU	No	Perennial	Herb
<i>Dicliptera fionae</i> K. Balkwill	VU	No	Perennial	Herb
<i>Searsia batophylla</i> (Codd) Moffett	VU	No	Perennial	Shrub
<i>Diplophium buchananii</i> (Benth. ex Oliv.) <i>C. Norman</i> subsp. <i>swynnertonii</i> (Baker f.) Cannon	VU	No	Perennial	Herb
<i>Brachystelma minor</i> E.A. Bruce	VU	No	Perennial	Geophyte, succulent
<i>Ceropegia cimiciodora</i> Oberm.	VU	No	Perennial	Climber, succulent
<i>Ceropegia stentiae</i> E.A. Bruce	VU	No	Perennial	Geophyte, succulent
<i>Huernia nouhuysii</i> I. Verd.	VU	No	Perennial	Succulent
<i>Zantedeschia jucunda</i> Letty	VU	No	Perennial	Geophyte, herb
<i>Asparagus fouriei</i> (Oberm.) Fellingham & N.L. Mey.	VU	No	Perennial	Shrub
<i>Asparagus hirsutus</i> S.M. Burrows	VU	No	[No lifecycle defined]	Dwarf shrub
<i>Aloe chortolirioides</i> A. Berger var. <i>chortolirioides</i>	VU	No	Perennial	Dwarf shrub, herb, succulent
<i>Aloe monotropa</i> I. Verd.	VU	No	Perennial	Herb, succulent
<i>Commelina rogersii</i> Burt Davy	VU	No	Perennial	Herb
<i>Cucumis humifructus</i> Stent	VU	No	Annual	Herb
<i>Cullen holubii</i> (Burt Davy) C.H. Stirt.	VU	No	Perennial	Shrub
<i>Rhynchosia vendae</i> C.H. Stirt.	VU	No	Perennial	Climber, herb
<i>Streptocarpus longiflorus</i> (Hilliard & B.L. Burt) T.J. Edwards	VU	No	Perennial	Herb, lithophyte
<i>Streptocarpus makabengensis</i> Hilliard	VU	No	[No lifecycle defined]	Herb
<i>Bowiea volubilis</i> Harv. ex Hook.f. subsp. <i>volubilis</i>	VU	No	Perennial	Climber, geophyte, succulent
<i>Ledebouria dolomiticola</i> S. Venter	VU	No	Perennial	Geophyte
<i>Ledebouria mokobulanensis</i> Hankey & T.J. Edwards	VU	No	[No lifecycle defined]	[No lifeform defined]
<i>Gladiolus sekukuniensis</i> P.J.D. Winter	VU	No	Perennial	Geophyte, herb
<i>Hesperantha saxicola</i> Goldblatt	VU	No	Perennial	Geophyte, herb
<i>Plectranthus porcatus</i> Van Jaarsv. & P.J.D. Winter	VU	No	Perennial	Shrub
<i>Ocotea kenyensis</i> (Chiov.) Robyns & R. Wilczek	VU	No	Perennial	Tree
<i>Marsilea farinosa</i> Launert subsp. <i>arrecta</i> J.E. Burrows	VU	No	Perennial	Herb, hydrophyte
<i>Lithops coleorum</i> S.A. Hammer & Uijis	VU	No	Perennial	Succulent
<i>Disa aristata</i> H.P. Linder	VU	No	Perennial	Geophyte, herb
<i>Eulophia coddii</i> A.V. Hall	VU	No	Perennial	Geophyte, herb
<i>Elytrophorus globularis</i> Hack.	VU	No	Annual	Graminoid
<i>Festuca dracomontana</i> H.P. Linder	VU	No	Perennial	Graminoid
<i>Oryza longistaminata</i> A. Chev. & Roehr.	VU	No	Perennial	Graminoid, hydrophyte
<i>Sartidia jucunda</i> (Schweick.) De Winter	VU	No	Perennial	Graminoid
<i>Prunus africana</i> (Hook.f.) Kalkman	VU	No	Perennial	Tree
<i>Thesium davidsonae</i> Brenan	VU	No	Perennial	Herb, parasite
<i>Thesium gracilentum</i> N.E. Br.	VU	No	Perennial	Herb, parasite
<i>Jamesbrittenia bergae</i> P. Lemmer	VU	No	Perennial	Dwarf shrub

Species	Threat status	SA Endemic	Lifecycle	Growth forms
<i>Cyphostemma hardyi</i> Retief	VU	No	Perennial	Shrub, succulent
<i>Encephalartos paucidentatus</i> Stapf & Burtt Davy	VU	No	Perennial	Shrub, tree
