CHAPTER 4 LAND-USE

II-1. INTRODUCTION (*Reference 25*)

This chapter provides information on the general land-use pattern within a radius of 20 km from the KNPS, with a more detailed description of the agricultural land-use and production in the area up to 16 km from the site. Information is also provided on the main collection points and processing installations for agricultural produce within a radius of 50 km (80 km for dairy products). Land-use information was obtained from the following sources:

aerial photography and South Africa 1:50 000 topo-cadastral sheets;
field checks; and
personal communication with the Philadelphia Farmers Association.

II-2. The General Land-Use Pattern

Drawing No. 14 illustrates the land-use pattern within the 20 km zone, classified in the following categories:

Cultivated land
Uncultivated land
Residential development
Industrial development
Dune areas
Vlei areas and river valleys

The land-use within a 5 km radius from KNPS is dominated by the Melkbosstrand urban strip along the coast. The area to the immediate east of KNPS consists of soil that is generally sandy and of low agricultural quality. Consequently this area is largely uncultivated. The northern area consists of Strandveld Coastal Shrublands. Poorly vegetated sands occur in the dune areas along the coast and further inland to the NNW of KNPS.

Agricultural land-use occurs beyond the 5 km radius, mainly within the NE to ESE sectors. The soil quality generally improves outwards

towards the 20 km radius and this is reflected in the intensity and quality of the agricultural output. The nature of the farming is typical of the Swartland with wheat and fodder crop cultivation dominating agricultural activities. The original Renosterbosveld vegetation has been eliminated to a large extent and only pockets of uncultivated land dispersed over the area remain. Dairy farming is also popular, but certain farms in the SE and ESE sectors have discontinued this type of farming (*Reference 1*).

Poultry farming occurs mainly within the NE sector, particularly in the area of smallholdings east of Atlantis. Expansion and intensification of agricultural usage closer in towards the KNPS site is unlikely because of poor quality of the soil, erratic rainfall and the influence of the sea. The limited potential of the soils to the south and southeast of KNPS renders the area more suitable to urban development extending from the south.

The industrial and residential towns of Atlantis form the most significant urban development to the north of KNPS. The residential town of Atlantis currently has a population of approximately 50 000 people (*Reference 4*). The growth of this town and the industrial area however, is relatively stagnant. The emphasis in terms of metropolitan growth has shifted to the area north of Milnerton (SSE and SE of KNPS). This shift is currently reflected in the rapid growth of the area immediately north of Table View. Residential development in this area is however still beyond the 10 km radius from KNPS. Scattered industries in the form of brickfields and waste sites also occur in the SE and SSE sectors. Extension of the industrial areas south of the Diep River characterise the SE sector around the 20 km radius.

The area between the coastline and Atlantis (NNW to NNE) has been identified for possible inclusion in the proposed West Coast Biosphere Reserve. The farms in the area are mostly state owned and provide an opportunity for inclusion into the proposed reserve (*Reference 4*). Apart from the environmental considerations, this proposal will also need to be examined in terms of greater, sub-regional planning perspectives (such as for instance the Atlantis Corridor Growth Management Plan which is still in its early stages of preparation).

Table T-4-1 summarises the present (1997) land-use in approximate areas and percentages for each land-use type.

II-3. Agricultural Land-Use

This section elaborates on agricultural production and land-use within the

16 km radius from KNPS.

Drawing No. 15 illustrates the cadastral subdivision of land as at 1997, indicating the general size and distribution of farming units. The land-use per segment is reflected on **Drawing No. 16**. **Drawing No. 17** provides information on agricultural production in respect of wheat, fodder, vegetables, milk and the number of dairy cows, arranged according to the distribution per segment. The production figures per segment are also given in tabular form for each of the abovementioned product types (**Tables T-4-2 to 4-6**) (**Reference 1 to 3**). Most of the information on production figures was provided by the Philadelphia Farmers Association (**Reference 1**) and is based on the current average annual production per unit of agricultural land.

1997 ANNULAR LAND USAGE FOR SECTORS NW TO S

Annular Distance (Km)	Cultivated Land 1		Uncultivatd Land 2		Dune Areas 3		Vlei Areas 4		Public Utilities 5		Urban Development

16 - 20	11420	44	11848	46	-	-	782	3	49	1	1 467	5	223	1		

Notes:

* Percentages are based on total land area per annulus;

Σ Columns 1 - 7 = 100%

** Residential development includes associated uses such as commercial, educational and recreational uses where applicable.

The first 5 km from KNPS show no agricultural production of any significance. The limited potential of the soil is responsible for the lack of agricultural activity.

The 5 to 7.5 km band reflects the first intensive agricultural use

between the NE and SSE sectors. Cultivated land is dominant in most of the segments falling in this area (*Drawing No. 16*). Wheat, fodder crops and dairy production are the main agricultural products. The NE sector contains a significant concentration of chicken farming activity.

The most fertile land occurs in the 10 to 16 km band. The ENE to ESE sectors are characterised by large, well-established wheat farms, with an accompanying high production of fodder crops. Some of the farms also have a well-established dairy production component as reflected in *Drawing No. 17*.

The NE sector is characterised by the smallholdings of Klein Dassenberg with more specialised farming activities. These activities include bee-farming, vegetables, chicken and egg production, stud-farming and dairy farming. The only significant vegetable production (mainly potatoes) occurs in this sector (*Reference 3*).

There is a decrease in agricultural production and land-use generally towards the south, mainly as a result of urban development and proximity to the sea. Most of the land north of Table View is owned in large tracts by property development companies and is destined for future urban development (*Reference 5*). The land to the north of KNPS was reserved for the Atlantis project, but the growth of urban development has not taken on the proportions initially envisaged. The nature of the soil precludes its use for extensive agricultural activities. The latest proposal in respect of this land is for its inclusion in the proposed West Coast Biosphere Reserve (*Reference 4*).

II-4. Distribution and Processing

Drawing No. 18 shows the major receiving depots for agricultural products as well as important processing installations, and should be read in conjunction with *Table T-4-8* which provides information on each particular depot per product type. The survey included an area up to 80 km from KNPS in respect of dairy products and 50 km for all other product types.

The distribution of dairy products is closely related to the urban concentrations. Most of the towns within the area have collection/distribution depots. The metropolitan area is supplied by distributors concentrated in the industrial areas of the Metropole.

The large depots for wheat products are located mainly in the bigger towns of the wheat growing area and at various stations along the railway lines that serve the area. Major distribution points for the milled product are concentrated in the town of Malmesbury and the industrial areas of the Metropole.

Fresh fruit depots are found at Cape Town Harbour (export purposes), the municipal markets in Cape Town and at the Spoornet stations in the surrounding towns. Depots of the dried fruit industry are confined to Wellington, Worcester and Wolseley. The canning industry is also bound to the outlying towns closer to the fruit producing areas.

Chicken and egg production is spread over the surrounding rural areas, with the large farms well separated for disease control purposes. The main collection and distribution points are centered in the industrial areas of Cape Town and Bellville.

The municipal abattoir in Maitland is by far the largest distribution point for raw meat in the metropolitan area. The Roelcor abattoir in Malmesbury is a major distribution point for the Swartland area. Processing and distribution points are concentrated in the industrial areas of the Metropole.
