DRAFT

Centella asiatica, *Chaetacanthus costatus*, *Commelina africana*, *Conyza bonariensis*, *Conyza podocephala*, *Crabbea acaulis*, *Crepis hypochaeridea*, *Cucumis zeyheri*, *Dicoma zeyheri*, *Eucomis autumnalis*, *Gladiolus crassifolius*, ***Helichrysum aureonitens***, *Helichrysum callicomum*, *Helichrysum coriaceum*, *Helichrysum rugulosum*, *Helichrysum setosum*, *Hermannia transvaalensis*, *Hibiscus trionum*, *Hypericum lalandii*, *Hypochaeris radicata*, *Hypoxis rigidula*, *Ledebouria ovatifolia*, *Leonotis intermedia*, ***Lobelia flaccida***, *Lotononis eriantha*, ***Monopsis decipiens***, *Nemesia fruticans*, *Nesaea schinzii*, *Nidorella anomala*, *Oenothera tetraptera*, *Oldenlandia herbacea*, *Pelargonium luridum*, *Peucedanum magalismontanum*, *Plantago lanceolata*, *Pollichia campestris*, *Polygala hottentotta*, *Pseudognaphalium luteo-album*, *Pygmaeothamnus zeyheri*, *Rabdosiella calycina*, *Raphionacme hirsuta*, *Rumex acetosella*, *Sebaea leiostyla*, ***Senecio achilleifolius***, ***Senecio erubescens***, *Senecio oxyriifolius*, *Senecio scitus*, *Silene burchellii*, *Solanum panduriforme*, *Sutera caerulea*, *Tephrosia capensis*, *Tephrosia elongata*, *Trifolium pratense*, ***Verbena bonariensis***, ***Verbena brasiliensis***, *Verbena tenuisecta*, *Vernonia hirsuta*, *Vernonia natalensis*, ***Wahlenbergia undulata***, *Walafrida densiflora*, *Zornia linearis*

Woody species: *Athrixia elata*, *Diospyros lycioides*, *Felicia filifolia*, *Otholobium polyphyllum*, *Protasparagus laricinus*, *Rhus discolor*, *Rhus magalismontana*, *Stoebe vulgaris*

This community represents either seasonal or temporary wetland areas, occurring in the landscape either in the headwater areas of drainage systems or as hillside seeps. The species associated with surface water (**bold and italics**) represents sub-community one, and experience at least seasonal inundation, while the other species (italics only) are associated with temporary wetland areas or zones. Sub-community one (Appendix B) is also associated with finer texture soils (clayey) (Table 10), while sub-community two, who occurs most probably on the edge of sub-community one is associated with coarse textured soils. The finer material is moved out of the higher lying areas into the lowerlying area, accompanied with the exposure of surface rock. Due to the finer textured soils and the presence of moisture these areas, especially those associated with sub-community one tends to be over utilised by livestock.

2. Shrub dominated utilised grassland on sandy clay loam soils with surface rock derived from mudrock

Phytosociological name: *Brachiaria serrata* - *Diospyros lycioides* shrub dominated sub-climax grassland on fine textured, rocky soils derived from mudrock

This community occurs on steeper slopes, mainly in the lower lying areas of the study area towards the east, due to it steeper slopes, it is less likely for water to accumulate in it (Table 10). However due to its strong association with mudrock (Table 11), it is associated with finer texture soils (average % clay within the A-horizon: 20%) (Table 10). Due to the presence of surface rock, shrubs reaching an average height of 1.3 m are present (Table 12).

The following species were recorded within this community:

Grasses: *Abildgaardia ovata*, *Alloteropsis semialata*, ***Aristida bipartita***, ***Aristida congesta***, ***Aristida junciformis***, *Aristida meridionalis*, *Bewsia biflora*, *Brachiaria serrata*, *Cymbopogon excavatus*, ***Cynodon dactylon***, *Diheteropogon amplexans*, *Elionurus muticus*, *Eragrostis capensis*, *Eragrostis chloromelas*, *Eragrostis curvula*, ***Eragrostis plana***, *Eragrostis racemosa*, ***Heteropogon contortus***, *Hyparrhenia dregeana*, *Hyparrhenia filipendula*, ***Hyparrhenia hirta***, *Kyllinga alba*, *Melinis nerviglumis*, *Microchloa caffra*, *Monocymbium ceresiiforme*, *Paspalum urvillei*, *Schizachyrium sanguineum*, *Scirpus burkei*, *Setaria sphacelata*, *Sporobolus africanus*, *Themeda triandra*, *Trachypogon spicatus*, *Tristachya leucothrix*, *Tristachya rehmannii*

Forbs: *Acalypha angustata*, *Acalypha peduncularis*, *Acrotome inflata*, *Agapanthus inapertus*, *Agrimonia procera*, *Alepidea natalensis*, *Anthericum fasciculatum*, *Anthospermum rigidum*, *Aristea woodii*, *Aster bakerianus*, *Becium obovatum*, *Berkheya insignis*, *Berkheya setifera*, *Berkheya speciosa*, *Bidens pilosa*, ***Boophone disticha***, *Chaetacanthus costatus*, *Cheilanthes viridis*, *Commelina africana*, *Conyza bonariensis*, *Conyza podocephala*, *Corchorus confusus*, *Corycium nigrescens*, *Crabbea acaulis*, *Crabbea ovalifolia*, *Crepis hypochaeridea*, *Cucumis hirsutus*, *Cucumis zeyheri*, *Dichapetalum cymosum*, *Dicoma anomala*, *Dicoma zeyheri*, *Eriosema salignum*, *Eriospermum species*, ***Eucomis autumnalis***, *Gazania krebsiana*, *Geigeria burkei*, *Gerbera piloselloides*, ***Gladiolus crassifolius***, *Habenaria lithophila*, ***Haemanthus species***, *Haplocarpha lyrata*, *Haplocarpha scaposa*, *Helichrysum acutatum*, *Helichrysum aureonitens*, *Helichrysum auriceps*, *Helichrysum cephaloideum*, *Helichrysum coriaceum*, *Helichrysum nudifolium*, *Helichrysum rugulosum*, *Helichrysum setosum*, *Hemizygia pretoriae*, *Hermannia depressa*, *Hermannia lancifolia*, *Hermannia transvaalensis*, *Hypericum aethiopicum*, ***Hypoxis hemerocallidea***, ***Hypoxis obtusa***, ***Hypoxis rigidula***, *Indigofera zeyheri*, *Ipomoea ommanneyi*, *Justicia anagalloides*, *Leonotis intermedia*, *Limeum sulcatum*, *Monopsis decipiens*, *Oldenlandia herbacea*, ***Pelargonium***

luridum, *Pellaea calomelanos*, *Pentanisia angustifolia*, *Pentanisia prunelloide*, *Phyllanthus parvulus*, *Plantago lanceolata*, *Pollichia campestris*, *Polygala hottentotta*, *Rabdosiella calycina*, *Raphionacme species*, *Satureja biflora*, *Scabiosa columbaria*, *Sebaea leiostyla*, *Senecio coronatus*, *Senecio erubescens*, *Senecio inornatus*, *Senecio lydenburgensis*, *Senecio scitus*, *Senecio venosus*, *Silene burchellii*, *Striga asiatica*, *Tephrosia capensis*, *Tephrosia elongata*, *Thesium utile*, *Thunbergia atriplicifolia*, *Verbena brasiliensis*, *Vernonia natalensis*, *Vernonia oligocephala*, *Wahlenbergia undulata*, *Walafrida densiflora*, *Zaluzianskya maritima*, *Zornia linearis*

Woody species: *Athrixia elata*, *Diospyros lycioides*, *Erythrina zeyheri*, *Protasparagus laricinus*, *Pyrenacantha grandiflora*, *Rhus discolor*, *Rhus tumulicola*, *Stoebe vulgaris*

This community at a landscape level presents sweetveld due to the presence of finer material, and should therefore be favoured by livestock. The source of the finer material is the *in situ* weathering of the mudrock on which it occurs. The presence of the grass species associated with grazing pressure (**bold & italic**) supports this statement, while the presence of the geophytes (bulbous forbs – **bold & italic**) indicates that the area is in general to steep and too shallow to plough. The presence of surface rock also protects the area from cultivation.

3. Shrub Climax grassland on loamy sand soils derived from sandstone

Phytosociological name: *Helichrysum acutatatum* - *Themeda triandra* climax grassland on coarse textured soils derived from sandstone

This community occurs on gentler slopes, mainly in the higher lying areas of the study area towards the west, due to its gentler slopes, it is more likely for water to accumulate in it (Table 10). However due to its strong association with sandstone (Table 11), it is associated with coarser texture soils (average % clay within the A-horizon: 13%) (Table 10). This community contains no surface rock (Table 10). This is a predominantly grassland community (Table 12).

The following species were recorded within this community:

Grasses: *Agrostis montevidensis*, *Alloteropsis semialata*, *Andropogon schirensis*, *Aristida congesta*, *Aristida junciformis*, *Aristida meridionalis*, *Aristida stipitata*, *Cyperus esculentus*, *Digitaria eriantha*, *Digitaria monodactyla*, *Diheteropogon amplexans*, *Ellionurus muticus*, *Eragrostis capensis*, *Eragrostis chloromelas*, *Eragrostis curvula*, ***Eragrostis gummiflua***, *Eragrostis nindensis*, *Eragrostis plana*, *Eragrostis racemosa*, ***Harpochloa falx***, *Helictotrichon turgidulum*, *Heteropogon contortus*, *Kyllinga alba*, *Loudetia simplex*, *Microchloa caffra*, *Miscanthus junceus*, *Monocymbium ceresiiforme*, *Panicum natalense*, *Setaria sphacelata*, *Themeda triandra*, ***Trachypogon spicatus***, ***Trichoneura grandiglumis***, ***Tristachya leucothrix***, ***Tristachya rehmannii***

Forbs: *Acalypha angustata*, *Acrotome hispida*, *Aeschynomene rehmannii*, *Anthericum cooperi*, *Anthospermum rigidum*, *Babiana hypogaea*, *Becium obovatum*, *Berkheya setifera*, *Boophone disticha*, *Chamaecrista mimosoides*, *Chlorophytum transvaalense*, *Commelina africana*, *Conyza bonariensis*, *Conyza podocephala*, *Crabbea acaulis*, *Crassula vaginata*, *Crepis hypochaeridea*, *Crocsmia paniculata*, *Cucumis hirsutus*, *Delosperma ashtonii*, *Dicoma anomala*, *Elephantorrhiza elephantina*, *Eriosema salignum*, *Eucomis autumnalis*, *Geigeria burkei*, *Gnidia caffra*, *Gnidia capitata*, *Haplocarpha lyrata*, *Helichrysum acutatatum*, *Helichrysum aureonitens*, *Helichrysum callicomum*, *Helichrysum cephaloideum*, *Helichrysum nudifolium*, *Helichrysum rugulosum*, *Hermannia lancifolia*, *Hermannia transvaalensis*, *Hibiscus aethiopicus*, *Hibiscus trionum*, *Hypericum aethiopicum*, *Hypoxis hemerocallidea*, *Hypoxis obtusa*, *Hypoxis rigidula*, *Indigofera hedyantha*, *Indigofera zeyheri*, *Ipomoea bathycolpos*, *Ipomoea ommanneyi*, *Justicia anagalloides*, *Kohautia amatymbica*, *Ledebouria cooperi*, *Ledebouria ovatifolia*, *Lobelia flaccida*, *Lotononis eriantha*, *Manulea parviflora*, *Monopsis decipiens*, *Moraea species*, *Nidorella hottentotica*, *Pelargonium luridum*, *Pentanisia angustifolia*, *Pollichia campestris*, *Pygmaeothamnus zeyheri*, *Raphionacme hirsuta*, *Rhynchosia totta*, *Rumex acetosella*, *Scabiosa columbaria*, *Sebaea grandis*, *Sebaea leiostyla*, *Senecio achilleifolius*, *Senecio coronatus*, *Senecio erubescens*, *Striga asiatica*, *Striga bilabiata*, *Sutera caerulea*, *Sutera neglecta*, *Tephrosia capensis*, *Tephrosia purpurea*, *Thunbergia atriplicifolia*, *Vernonia natalensis*, *Vernonia oligocephala*, *Wahlenbergia undulata*, *Watsonia densiflora*, *Zornia linearis*

Woody species: *Diospyros lycioides*, *Stoebe vulgaris*

This community at a landscape level are transitional between the lowlying sweetveld and highlying sourveld due to the presence of coarser material, it is utilised by livestock during the summer months. The source of the coarser material is the *in situ* weathering of the sandstone on which it occurs. The presence of the grass species associated with lower grazing pressure (**bold & italic**) and climax

conditions supports this statement. Due to the absence of surface rock and less steep slopes, this community is most likely to be used for cultivation in the future.

4. Short climax grassland on highlying areas associated with very shallow, sandy soils large rocks and boulders on quartzite rock

Phytosociological name: *Stachys natalensis* - *Monocymbium ceresiiforme* short grassland on large outcrops with very shallow, very coarse textured soils derived from quartzite

This community occurs on the higher lying areas, mainly crests of the study area (Table 10). The quartzite is more resistant to weathering (Table 11), while its position in the landscape results in the removal of finer materials, resulting in coarser textured soils being present (average % clay within the A-horizon: 8% - Table 10). This community contains the most surface rock, specifically large boulders and rock sheets and its soil depth is the shallowest (Table 10). Due to the presence of surface rock, shrubs are present (Table 12).

The following species were recorded within this community:

Grasses: *Abildgaardia ovata*, *Alloterospis semialata*, *Aristida congesta*, *Aristida junciformis*, *Aristida meridionalis*, *Brachiaria serrata*, *Cymbopogon excavatus*, *Cyperus rupestris*, *Diheteropogon amplectens*, *Elionurus muticus*, *Eragrostis chloromelas*, *Eragrostis curvula*, *Eragrostis nindensis*, *Eragrostis plana*, *Eragrostis racemosa*, *Harpochloa falx*, *Heteropogon contortus*, *Loudetia simplex*, *Melinis nerviglumis*, *Melinis repens*, *Microchloa caffra*, *Monocymbium ceresiiforme*, *Panicum natalense*, *Schizachyrium sanguineum*, *Sporobolus pectinatus*, *Trachypogon spicatus*, *Tristachya leucothrix*, *Tristachya rehmannii*, *Urelytrum agropyroides*

Forbs: *Acalypha angustata*, *Achyranthes aspera*, *Aeschynomene rehmannii*, *Anthericum cooperi*, *Anthospermum hispidulum*, *Anthospermum rigidum*, *Aristea woodii*, *Aster peglerae*, *Babiana hypogaea*, *Castalis spectabilis*, *Chamaecrista mimosoides*, *Cheilanthes viridis*, *Commelina africana*, *Crassula setulosa*, *Crepis hypochaeridea*, *Delosperma ashtonii*, *Elephantorrhiza elephantina*, *Gladiolus ecklonii*, *Gnidia caffra*, *Gnidia capitata*, *Helichrysum acutatum*, *Helichrysum callicomum*, *Helichrysum nudifolium*, *Helichrysum setosum*, *Hemizygia pretoriae*, *Hermannia lancifolia*, *Hermannia transvaalensis*, *Hypoxis obtusa*, *Indigofera hedyantha*, *Ipomoea ommanneyi*, *Kalanchoe thyrsiflora*, *Manulea parviflora*, *Monsonia angustifolia*, *Nerine rehmannii*, *Oldenlandia herbacea*, *Oxygonum dregeanum*, *Pellaea calomelanos*, *Pentanisia angustifolia*, *Pygmaeothamnus zeyheri*, *Rabdosiella calycina*, *Raphionacme species*, *Rumex acetosella*, *Scabiosa columbaria*, *Sebaea leiostyla*, *Selaginella dregei*, *Senecio lydenburgensis*, *Senecio oxyriifolius*, *Senecio scitus*, *Senecio venosus*, *Silene burchellii*, *Stachys natalensis*, *Tephrosia elongata*, *Tetraselago natalensis*, *Ursinia nana*, *Vernonia galpinii*, *Wahlenbergia epacridea*, *Wahlenbergia undulata*, *Walafrida densiflora*, *Zornia linearis*

Woody species: *Diospyros lycioides*, *Felicia filifolia*, *Lopholaena coriifolia*, *Parinari capensis*, *Protea welwitschii*, *Rhus tumulicola*

This community occurs on the ridges within the landscape, more specifically on the crests. Due to its very coarse texture, it represents sourveld. Its shallow soils and very steep slopes protect it from exploitation, whether for grazing or cultivation. This community represents the driest unit in the landscape because the low tendency for water to accumulate in the landscape. However the ruggedness of the terrain (rockiness) does favour localised infiltration of rain water, which enables the establishment of woody species, while protecting them from intensive veld fires.

Overall it can be concluded that these four communities are typical of the remaining grassland in the landscape, which has not been ploughed because they are either to wet, to shallow, to steep, to rocky or a combination of these factors. It is expected that the remaining grassland in the west will experience higher grazing pressure than the grassland to the east, where the landscape is more intact (Figure 11). The increase in estimated cover abundance of grass species associated low grazing pressure (decreaser species) from west to east and an decrease in increaser species (high grazing pressure)(, supports this statement.

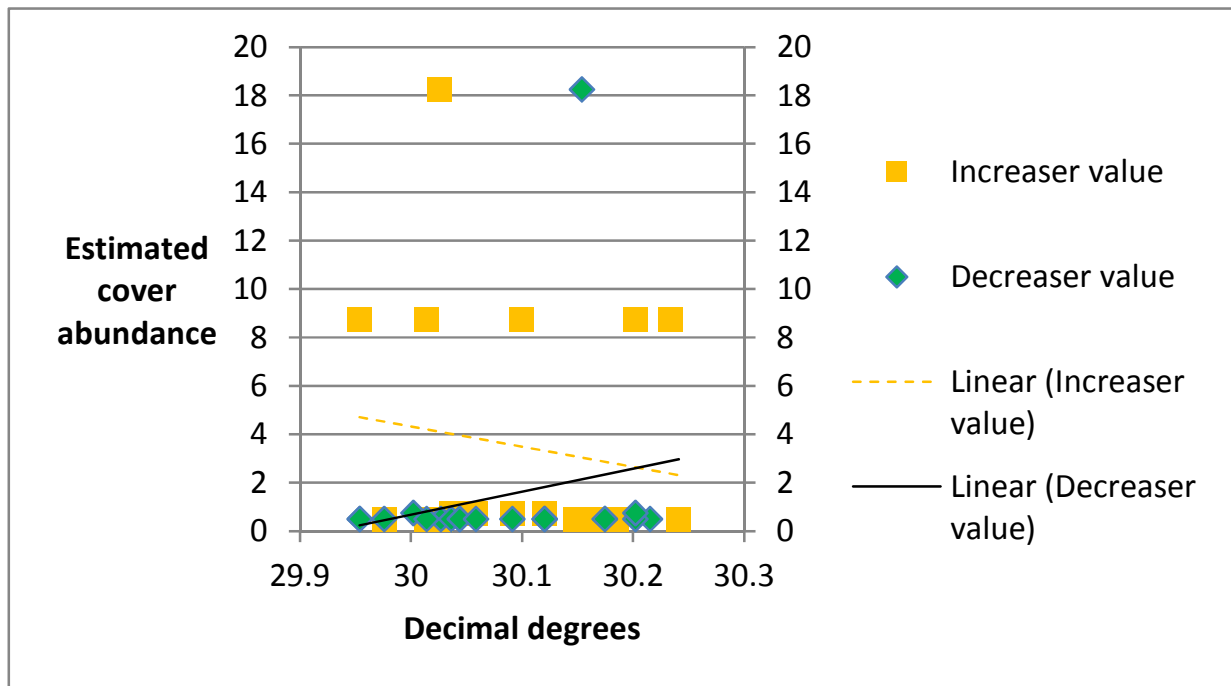

Figure 13: Overview of the grazing pressure experienced by the grassland areas within the study area from west to east based on the estimated cover abundance of increaser and decreaser grass species.

5.2.2 Species diversity

Species richness

A total of 245 species were recorded during the survey, representing 57 plant families, of which 165 species (68%) are forbs, 63 species (26%) are grasses/ graminoids and 14 species (6%) are woody species (Table 13).

It is evident that forbs form a significant component of the herbaceous layer, in terms of species richness at forb: grass ratio of 3:1 (Table 13). Therefore forbs should form a critical component of the rehabilitation mixture especially species from the Asteraceae and Fabaceae families (Appendix C).

Threatened and protected species

Two threatened (Vulnerable, Endangered, Critical Endangered) plant species according to the latest Red Data flora assessment from SANBI⁵, was recorded during the survey, namely *Crassula setulosa* Harv. var. *deminuta* (Diels) Toelken (Vulnerable) and *Helichrysum aureum* (Houtt.) Merr. var. *argenteum* Hilliard (Vulnerable). *Crassula setulosa* was observed in community 4. However, these two species were not positively identified by taxonomic specialists and therefore their identity and status should be verified prior to construction. In addition provision was made for the presence of other threatened Red Data flora in the flora sensitivity model, because obviously it was not possible to cover every square metre of the study area within the current scope of the project.

The following twelve species, which are protected in terms of the Mpumalanga Nature Conservation Ordinance, were recorded during the survey; they are *Agapanthus campanulatus*, *Agapanthus inapertus*, *Eucomis autumnalis*, *Gladiolus crassifolius*, *Gladiolus ecklonii*, *Haemanthus species*, *Watsonia densiflora*, *Corycium nigrescens*, *Habenaria lithophila*, *Protea welwitschii*, *Boophane disticha*, *Haemanthus species*. It should be noted that all species from the genera *Agapanthus*, *Eucomis*, *Gladiolus*, *Haemanthus* and *Watsonia* are protected as well as all species from the families Orchidaceae (*Habenaria* species and others) and Proteaceae. It is evident that these species occur throughout the study area where natural vegetation is remaining (Table 14). **Protected species in terms of the Conservation Ordinance requires a permit for their removal/ translocation and if used in commercial activities.**

Medicinal Plants

Nine species with medicinal properties were recorded within the survey; they are *Centella asiatica*, *Elephantorrhiza elephantina*, *Eucomis autumnalis* subsp. *autumnalis*, *Hypoxis hemerocallidea*, *Pelargonium luridum*, *Pellaea calomelanos* var. *calomelanos*, *Pentanisia prunelloides* subsp. *prunelloides*, *Scabiosa columbaria* and *Vernonia oligocephala*. These species were present throughout the study area (Table 15); they do not have specific conservation status, but do run the risk of being exploited during the construction phase in the vicinity of construction camps.

Alien invasive species

No alien invasive species were recorded in the natural areas that were sampled during the survey. However, declared alien invasive woody species are present within the landscape, mainly associated with forestry for example *Acacia mearnsii* (Wattle) and *Eucalyptus* species (Bluegum) and *Pinus* (Pine). Other weeds and/ declared invasive species will occur in the cultivated lands or old fields.

Localised biodiversity hotspots

Based on the observation made during the survey, it is apparent that rocky areas present localised biodiversity hotspots, containing (Figure 14):

1. between 10% and 70% more species than was recorded on average per plot (35 species) (Table 16)

⁵ <http://posa.sanbi.org/searchsp.php>

Table 13: Overview of the plant families and growth forms recorded during the survey

| Plant family | Growth Forms | | | Plant Family Statistics | | |
|------------------|--------------|---------|---------------|-------------------------|-------------|------------------------|
| | Forbs | Grasses | Woody species | Species per family | % Frequency | Cumulative % Frequency |
| Poaceae | | 53 | | 53 | 22% | 22% |

6 EVALUATION OF THE PROPOSED ROUTE ALTERNATIVES

To ensure objectivity and transparency two models of sensitivity were used to evaluate the three proposed route alternatives in terms of which of the three proposed route alternatives will:

1. cross the most least sensitive areas
2. avoid the most sensitive areas.

The one model was derived from the results of the literature review, taking in consideration the sensitive ecosystems and threatened species present in the area (Figure 11). The second model is the KwaZulu-Natal Ezemvelo's Conservation Plan (C-Plan) (Figure 5).

6.1 Flora Sensitivity Model

This model was compiled by rating/ weighting landscape features obtained from small-scale datasets (refer to the Ecosystem Diversity Section) and associated with potential habitat for threatened flora a value of between one (1) and five (5). The landscape features that were used were:

1. Geology
2. Altitudinal Classes
3. Landform
4. Topography
5. Landtype
6. National land cover 2000
7. Vegmap 2006

The different layers were cumulatively combined and then divide by the number of layers to produce the flora sensitivity layer. This layer was then incorporated into the total sensitivity layer. However for the purpose of this document, the extent/ percentage cover of very low, low, moderate, high and very high sensitivity areas were extracted per route alternative's two kilometre (2 km) corridor from the flora sensitivity layer (Figure 7, Table 17).

Based on the flora sensitivity model, alternative 5 associated with the least cost model, is the least sensitivity and the most suitable for the construction of the power line from a flora perspective. Alternative 1 is the most sensitive and therefore the least suitable for the construction of the power line.

6.2 Mpumalanga Parks Board Conservation Plan

Analysis of the Mpumalanga Conservation Plan supports/ confirms the results at scoping level from the flora sensitivity analysis that route alternative five is the least environmental sensitive alignment and therefore the preferred alignment in terms of vegetation (Table 18). This statement is based on the following factors:

1. Route alternative five includes the highest percentage of no natural habitat remaining (50%)
2. Route alternative five includes no irreplaceable areas

In addition to the above two models which provided similar results, two more parameters were evaluated, namely:

1. Ruggedness, which correlates with slope and therefore rockiness, which during the field survey was associated with localised areas of high species diversity
2. The ratio of natural vegetation, which represent potential habitat for threatened flora against the transformed areas.

Table 17: Overview of the extent and percentage cover of sensitive flora habitat within the landscape per two kilometre route alternative corridor

| Irreplaceable | 2% | 1% | 0% |
| TOTALS | 100% | 100% | 100% |
| Sensitivity | Most | | Least |
| Suitability | Least | | Most |

Slopes of more than 5° are associated with ridges and geological formations often outcrops or represents these ridges, the presence of the rock provides microhabitat for species to colonise/ inhabit, resulting in the increase presence of species in general. With regards to ruggedness the least sensitive and therefore the most suitable route corridor is corridor three, with alternative one remaining the most sensitive and therefore the least suitable (Table 19).

When considering the ratio of natural to transformed areas per route corridor alternative, alternative five (5) is once again the least sensitive and therefore the most suitable (Table 20) because it contains the highest percentage of transformed land at 70%.

7 CONCLUSION

The proposed power line will transect mainly grassland, the literature – and desktop review indicated that these grassland areas are sensitive and threatened.

Of the three proposed route alternatives, route alternative five is the least sensitive in terms of the vegetation and therefore the preferred route alignment, with route alternative one the overall most sensitive and should therefore be avoided from a floristic perspective (Table 21) in a green fields scenario.

However, the weighted difference between alternative 5 and 3 is not as large as between alternative 5 and 1, and therefore alternative 3 could be considered because it occurs in an area where existing impacts are present. International literature indicates that it is preferable to keep impacts together rather than spreading it through the landscape, by keeping impacts together especially linear infrastructure, habitat loss and – fragmentation is reduced (Forman *et al* 2003, Hilty *et al* 2006).

8 ENVIRONMENTAL IMPACT ASSESSMENT

The impacts associated with the proposed project relevant to the flora of the study were assessed in terms of the following criteria:

- ~ Nature
- ~ Extent
- ~ Duration
- ~ Intensity
- ~ Frequency of occurrence
- ~ Probability of occurrence
- ~ Significance
- ~ Status
- ~ Degree of confidence

Where relevant, criteria were scored in terms of severity and the significance of each criterion estimated based on the total score of each impact.

The following classes and scores were used during the scoring of impacts:

1. Nature of impact: a description of each impact. No scoring relevant.
2. Extent: 1 = limited to the immediate study area; 2 = including a 2 km radius surrounding the immediate study area; 3 = a major portion of an area or province affected; 4 = impact has a national or international relevance.
3. Duration: 1 = impact has a short-term implication (0-3 years); 2 = impact has a medium-term implication (4-10 years); 3 = impact has a long-term implication (10+ years); 4 = permanent.
4. Intensity: 1 = very low; 2 = low; 3 = medium; 4 = high.
5. Frequency of occurrence: 1 = Time-linked; 2 = periodic; 3 = intermittent; 4 = continuous.
6. Probability of occurrence: 1 = improbable; 2 = probable; 3 = highly probable; 4 = definite.
7. Significance: based on above-mentioned scores, on of three classes: low, moderate, high.
8. Status: positive, negative or neutral.
9. Degree of confidence: estimated percentage (in classes of 5%) of confidence in estimating the significance of each impact.

Impacts were assessed separately for four activities related to the proposed project, based on their differing associated impacts and impact levels (or significance):

- ~ Construction camps
- ~ Burrow pits
- ~ Power line itself
- ~ Access roads

It had been observed that once established the power lines have no to very low impact on the vegetation within the study area. This had been confirmed during various EIA studies of the power lines in the grassland over the past 17 years. Evidence of soil erosion or other disturbance due to the power line are seldom observed, exploitation of the veld in terms of grazing and quarries has much more significant impact than established power lines. The major concern is in terms of the edge effects of the construction phase:

1. Unauthorised off-road driving
 2. Removal of medicinal or aesthetic plants
 3. The harvesting of wood from drainage lines or outcrops or bush clumps for warming and cooking
- If these activities could be strictly controlled, the mitigation will be highly effective and the impact of the proposed power lines, irrespective of the alternative will be definitely very low in the long term.

IMPACT: Removal of vegetation at construction camps and burrow pits

In the long term and on a local scale, the removal of natural vegetation at the construction sites and burrow pits will have a moderate negative impact.

MITIGATION: Placing construction camps in all ready transformed areas such as cultivated fields or revamping derelict homesteads or other abandoned infrastructure can mitigate this impact. New burrow pits should be kept to the minimum; existing one should rather be used than new ones created. If successfully mitigated, the impact on the vegetation could be considered low on a local scale in the long term.

IMPACT: Harvesting of medicinal plants and wood

Harvesting of medicinal plants and wood for cooking have a moderate negative impact on the population dynamics and vegetation structure on a local scale and in the long term.

MITIGATION: The following mitigation is recommended:

1. Construction companies should make sure that the necessary medical facilities are available for their staff on site. The Health and Safety Act will most probably cover this aspect.
2. Gas and electrical cooking facilities should be provided. The same apply to heating during the winter months. Open fires should be discouraged and only used under controlled circumstance, as the area is prone to large fires on a regular basis (Figure 15). Care should be especially taken during the late winter/ early spring months (June, July, August, September).

If successfully mitigated, the impact on the vegetation could be considered low on a local scale in the long term.

IMPACT: Construction of access roads

The construction of access roads will also result in the removal of natural vegetation especially in rugged terrain to obtain access. This would have a high negative impact on a local scale in the long term.

MITIGATION: Where possible existing routes into rugged terrain should be used and enhanced. If the access roads are required to cross green fields (untransformed) areas, it is strongly recommended that the plants present be surveyed, collected for documentation at SANBI, medicinal plants rescued instead of being destroyed and rare or threatened species moved to nurseries for re-establishment after construction or used for rehabilitation in areas where construction activities had result in the significant loss of natural vegetation. If successfully mitigated, the impact on the vegetation could be considered moderate on a local scale in the long term.

IMPACT: Alien vegetation control at construction camps, within servitudes and along access roads

MITIGATION: Where encountered, declared alien vegetation should be controlled and the spread thereof proactively managed. Declared alien vegetation should be controlled and removed in compliance with the Conservation of Agricultural Resource Act and the National Environmental Management Biodiversity Act. If successfully implemented, the impact on the vegetation could be considered moderately positive on a local scale in the long term.

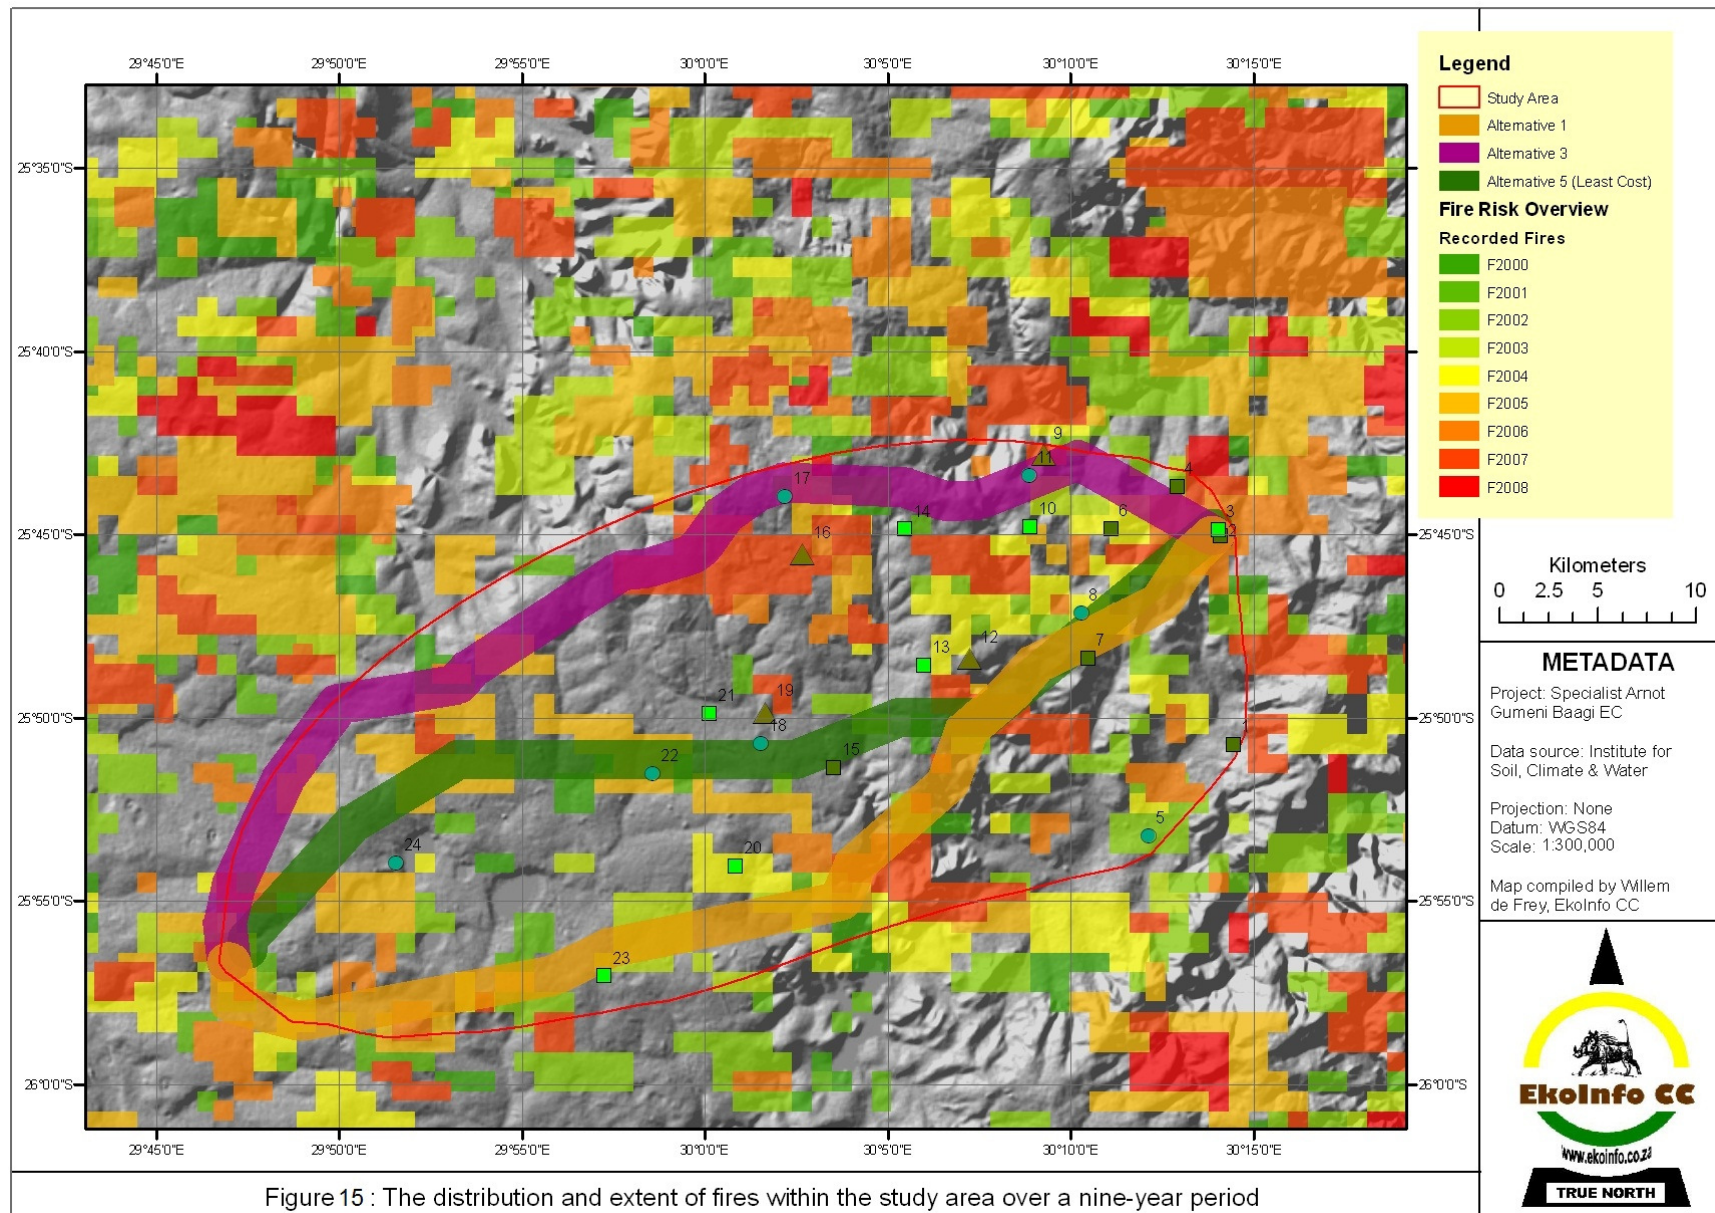

Figure 15 : The distribution and extent of fires within the study area over a nine-year period

Table 22: The assessment of impacts relevant to the flora aspect of the project. Impacts are assessed separately for construction camps, burrow pits, the power line and access roads.

DRAFT

9 FLORA GENERIC ENVIRONMENTAL MANAGEMENT PLAN

Although in the absence of a walk down and detail assessment of potential sensitive areas, it is not possible to conclude whether the construction activities will negatively affect any threatened flora, however the natural vegetation is used for grazing. Therefore dust should be controlled.

The footprint of the construction activity should be kept to the minimal; especially uncontrolled off-road driving should be curtailed. Infrastructure and storage facilities such as the construction camp should preferably be located on existing transformed areas such as cultivated land, where these areas are not within 350 m of the temporal zones of any wetlands, whether drainage line associated or hillsides.

Unlawful harvesting of medicinal plants and woody species, especially protected species, should be prevented.

Any declared weeds and invasive species encountered during the construction phase, should be eradicated and controlled according to the guidelines of the Conservation of Agricultural Resources Act No 43 of 1985. The management and controlling of declared weeds and invasive species should be an ongoing process during the operational phase.

11 APPENDIX A – ABRIDGE CV, PRINCIPLE CONSULTANT

Name of firm: EkolInfo cc Environmental and Wildlife Management Consultancy

Name of staff: WILLEM HENDRIK DE FREY

Profession: Environmental and Wildlife Management consultant

Years with firm: Since 1995

Nationality: RSA

Membership of professional societies:

The South African Council for Natural Scientific Professions (Reg no 400100/02)

Categories: Botanical Science and Ecological Science

Currently in the process of affiliating to:

South African Association of Botanist (SAAB)

Grassland Society of Southern Africa

South African Institute of Ecologist and Environmental Scientists (SAIE)

KEY QUALIFICATIONS:

Mr W de Frey has been involved in the discipline of ecology since 1989. During this period he prepared himself for a profession in environmental and wildlife management, by attending courses in chemistry, geology, pedology and statistics, while majoring in Botany and Zoology. His working knowledge was obtained while completing projects for his post-graduate studies in wildlife management in both the Savanna and Grassland Biomes. In addition to his academic publications, he has contributed to numerous reports regarding EMPR's, EIA's, vegetation - and soil surveys and monitoring since the registration of his own consultation close corporation in 1995. He is actively involved in the management and marketing of his close corporation while completing tasks in his field of expertise namely soil, vegetation science and Geographical Information Systems. Mr W de Frey is task orientated with consideration of people's needs and safety. He believes in a holistic approach to environmental and wildlife management and has therefore established a network with individuals in related fields. He is also assisting previously disadvantaged persons in establishing a presence in the environmental industry, namely Lordwick Makhura of Baagi Environmental Consultancy CC and a joint venture company Bonolo Biodiversity And Environmental Management consisting of Baagi Environmental Consultancy CC and Disa Mphago Community Helpers CC.

EDUCATION:

1992 BSc Botany & Zoology, University of Pretoria

| Course | Content | Level |
|------------|--|--|
| Chemistry | Organic and Inorganic chemistry | 1 st year |
| Geology | Introduction/ Geomorphology, Stratigraphy, Structural, Sedimentology Palaeontology, Crystallography | 1 st and 2 nd year |
| Pedology | Introduction, soil classification, soil fertility, soil ecology, soil physics | 1 st and 2 nd year |
| Botany | Morphology, Anatomy, Physiology, Taxonomy, Mycology, Ecology, Reproductive biology | 1 st , 2 nd and 3 rd year |
| Zoology | Taxonomy (Vertebrates and Invertebrates), Physiology (mainly vertebrates), Ecology (mainly vertebrates), Animal behaviour (mainly vertebrates) | 1 st , 2 nd and 3 rd year |
| Statistics | Sampling methods, Statistical Analysis, Probabilities | 1 st year |

1993 BSc (Hons) (Cum laude) Wildlife Management, University of Pretoria

Dissertation: 'N HOLISTIESE EKOLOGIESE BENADERING TOT DIE DRAKRAGBEPALING VAN 'N GEMENGDE WILD- EN BEESBOERDERY IN DIE UBOMBO DISTRIK, MET ENKELE BESTUURS AANBEVELINGS, 1993

1999 MSc (Cum laude) Wildlife Management, University of Pretoria

Thesis: PHYTOSOCIOLOGY OF THE MPUMALANGA HIGH ALTITUDE GRASSLANDS, 1999

COURSES/ WORKSHOPS ATTENDED

1. Red List And Threatened Species Assessment Training Workshop, Hosted by the Conservation Breeding Specialist Group Southern Africa & Endangered Wildlife Trust, December 2003
2. National State of the Environment Workshop, Hosted by DEAT and SRK, ESKOM Convention Centre – November 2004
3. Gauteng Red Data Flora Workshop, Hosted by SANBI and GDACE – November 2005
4. Gauteng Flora Minimum Requirement Workshop, Hosted by GDACE Nature Conservation – August 2007

EMPLOYMENT RECORD:

1986 – 1987

5 Signals Regiment, SADF

1998 – 1993 – Partime

Council of Geoscience, Palaeontology Section

University of Pretoria, Botany Department

Academy of Marksmanship, Range Officer

U Huisoppasser, Own enterprise

1994 – 1995

University of Pretoria, Botany Department, Assistant researcher

1995 – present

EkolInfo cc Environmental and Wildlife Management Consultancy, Founding member and consultant

Overall EkolInfo CC's principal consultant completed or administrated more than 58 vegetation studies as part of Environmental Impact Assessments within all of South Africa's nine provinces and adjacent countries such as Botswana and Mozambique with a focus on either terrestrial vegetation and/ or wetlands. Some projects were on provincial level such as the Mpumalanga and Gauteng Degradation Projects coordinated by the Institute for Soil, Climate and Water and sponsored by National Department of Agriculture. The majority of projects were on local scale from 5 ha to 50 000 ha or more for local developers and corporate institutions (SASOL, Anglo Coal, BHP Billington, Ingwe Coal, Deneys Rietz Attorneys, ESKOM) facilitated independently or as a subcontractor/ specialist for the following institutions: Oryx Environmental CC, African EPA, Arcuss Gibb, Digby Wells and Associates, Nature and Business Alliance and Eyethu Engineers, Strategic Environmental Focus.

COMMUNITY SERVICE

1. Substitute lecture – 2nd & 3rd year Botany Practical (Vegetation Survey Methods), University of Pretoria -1994 & 1995
2. Guest lecture – Wetland Vegetation Communities (2nd year students), Department of Landscape Architecture, University of Pretoria – 1996 & 1997
3. Guest lecture – Principles of Ecology (1st year students), Department of Landscape Architecture, University of Pretoria – 2002
4. Guest lecture – Principles of vegetation survey and mapping for EIA's (3rd year students), Department of Landscape Architecture, University of Pretoria – 2003
5. Referee – ILASA Merits Awards (Environmental Planning), Institute for Landscape Architects of South Africa - 2003

DRAFT

13 APPENDIX C – LIST OF FLORA SPECIES RECORDED PER FAMILY

Note: FAMILY and species in alphabetical order

ACANTHACEAE

Chaetacanthus costatus

Crabbea acaulis

Crabbea ovalifolia

Justicia anagalloides

Thunbergia atriplicifolia

AGAPANTHACEAE

Agapanthus campanulatus

Agapanthus inapertus

AMARANTHACEAE

Achyranthes aspera

AMARYLLIDACEAE

Haemanthus species

Nerine rehmannii

ANACARDIACEAE

Rhus discolor

Rhus magalismsontana

Rhus tumulicola

ANTHERICACEAE

Chlorophytum cooperi

Chlorophytum fasciculatum

Chlorophytum transvaalense

APIACEAE

Alepidea natalensis

Centella asiatica

Peucedanum magalismsontanum

APOCYNACEAE

Raphionacme hirsuta

Raphionacme species

ASPARAGACEAE

Asparagus laricinus

ASPHODELACEAE

Aloe boylei

Bulbine narcissifolia

ASTERACEAE

Aster bakeranus

Aster peglerae

Athrixia elata

Berkheya insignis

Berkheya radula

Berkheya setifera

Berkheya speciosa

Bidens pilosa

Conyza bonariensis

Conyza podocephala

Crepis hypochoeridea

Dicoma anomala

Dicoma zeyheri

Dimorphotheca spectabilis

Felicia filifolia

Gazania krebsiana

Geigeria burkei

Gerbera piloselloides

Haplocarpha lyrata

Haplocarpha scaposa

Helichrysum acutatum

Helichrysum aureonitens

Helichrysum aureum

Helichrysum callicomum

Helichrysum cephaloideum

Helichrysum coriaceum

Helichrysum nudifolium

Helichrysum rugulosum

Helichrysum setosum

Hypochaeris radicata

Lopholaena coriifolia

Nidorella anomala

Nidorella hottentotica

Pseudognaphalium luteo-album

Senecio achilleifolius

Senecio coronatus

Senecio erubescens

Senecio inornatus

Senecio lydenburgensis

Senecio oxyriifolius

Senecio scitus

Senecio venosus

Stoebe vulgaris

Ursinia nana

Vernonia galpinii

Vernonia hirsuta

Vernonia natalensis

Vernonia oligocephala

CAMPANULACEAE

Wahlenbergia epacridea

Wahlenbergia undulata

| | |
|-----------------------------|--------------------------|
| CARYOPHYLLACEAE | Tephrosia capensis |
| Pollichia campestris | Tephrosia elongata |
| Silene burchellii | Tephrosia purpurea |
| CHRYSOBALANACEAE | Trifolium pratense |
| Parinari capensis | Zornia linearis |
| COMMELINACEAE | GENTIANACEAE |
| Commelina africana | Sebaea grandis |
| CONVOLVULACEAE | Sebaea leiostyla |
| Ipomoea bathycolpos | GERANIACEAE |
| Ipomoea ommaneyi | Monsonia angustifolia |
| CRASSULACEAE | Pelargonium luridum |
| Crassula setulosa | HYACINTHACEAE |
| Crassula vaginata | Eucomis autumnalis |
| Kalanchoe thyrsiflora | Ledebouria cooperi |
| CUCURBITACEAE | Ledebouria ovatifolia |
| Cucumis hirsutus | HYPERICACEAE |
| Cucumis zeyheri | Hypericum aethiopicum |
| CYPERACEAE | Hypericum lalandii |
| Abildgaardia ovata | HYPOXIDACEAE |
| Cyperus denudatus | Hypoxis hemerocallidea |
| Cyperus esculentus | Hypoxis iridifolia |
| Cyperus rupestris | Hypoxis rigidula |
| Fuirena pubescens | ICACINACEAE |
| Kyllinga alba | Pyrenacantha grandiflora |
| Pycnus nitidus | IRIDACEAE |
| Schoenoplectus paludicola | Aristea woodii |
| Scirpus burkei | Babiana hypogea |
| DICHAPETALACEAE | Crocasmia paniculata |
| Dichapetalum cymosum | Gladiolus crassifolius |
| DIPSACACEAE | Gladiolus ecklonii |
| Scabiosa columbaria | Moraea species |
| EBENACEAE | Watsonia densiflora |
| Diospyros lycioides | JUNCACEAE |
| ERIOSPERMACEAE | Juncus lomatoophyllus |
| Eriospermum species | LAMIACEAE |
| EUPHORBIACEAE | Acrotome hispida |
| Acalypha angustata | Acrotome inflata |
| Acalypha peduncularis | Becium obovatum |
| FABACEAE | Hemizygia pretoriae |
| Aeschynomene rehmannii | Leonotis ocymifolia |
| Chamaecrista mimosoides | Rabdosiella calycina |
| Elephantorrhiza elephantina | Satureja biflora |
| Eriosema salignum | Stachys natalensis |
| Erythrina zeyheri | LOBELIACEAE |
| Indigofera hedyantha | Lobelia flaccida |
| Indigofera zeyheri | Monopsis decipiens |
| Lotononis eriantha | LYTHRACEAE |
| Otholobium polystictum | Nesaea schinzii |
| Rhynchosia totta | MALVACEAE |

| | |
|---------------------------|---------------------------|
| Corchorus confusus | Eragrostis racemosa |
| Hermannia depressa | Harpochloa falx |
| Hermannia lancifolia | Helictotrichon turgidulum |
| Hermannia transvaalensis | Heteropogon contortus |
| Hibiscus aethiopicus | Hyparrhenia dregeana |
| Hibiscus trionum | Hyparrhenia filipendula |
| MESEMBRYANTHACEAE | Hyparrhenia hirta |
| Delosperma ashtonii | Imperata cylindrica |
| MOLLUGINACEAE | Loudetia simplex |
| Limeum sulcatum | Melinis nerviglumis |
| ONAGRACEAE | Melinis repens |
| Oenothera tetraptera | Microchloa caffra |
| ORCHIDACEAE | Miscanthus junceus |
| Corycium nigrescens | Monocymbium cerasiiforme |
| Habenaria lithophila | Panicum natalense |
| OROBANCHACEAE | Paspalum urvillei |
| Striga asiatica | Pogonarthria squarrosa |
| Striga bilabiata | Schizachyrium sanguineum |
| PHYLLANTHACEAE | Setaria sphacelata |
| Phyllanthus parvulus | Sporobolus africanus |
| PLANTAGINACEAE | Sporobolus pectinatus |
| Plantago lanceolata | Themeda triandra |
| POACEAE | Trachypogon spicatus |
| Agrostis eriantha | Trichoneura grandiglumis |
| Agrostis montevidensis | Tristachya leucothrix |
| Alloteropsis semialata | Tristachya rehmannii |
| Andropogon appendiculatus | Urelytrum agropyroides |
| Andropogon schirensis | POLYGALACEAE |
| Aristida bipartita | Polygala hottentotta |
| Aristida congesta | POLYGONACEAE |
| Aristida junciformis | Oxygonum dregeanum |
| Aristida meridionalis | Rumex acetosella |
| Aristida sciurus | PROTEACEAE |
| Aristida stipitata | Protea welwitschii |
| Arundinella nepalensis | PTERIDACEAE |
| Bewsia biflora | Cheilanthes viridis |
| Brachiaria serrata | Pellaea calomelanos |
| Cymbopogon excavatus | ROSACEAE |
| Cynodon dactylon | Agrimonia procera |
| Digitaria eriantha | RUBIACEAE |
| Digitaria monodactyla | Anthospermum hispidulum |
| Diheteropogon amplexens | Anthospermum rigidum |
| Elionurus muticus | Kohautia amatymbica |
| Eragrostis capensis | Oldenlandia herbacea |
| Eragrostis chloromelas | Pentanisia angustifolia |
| Eragrostis curvula | Pentanisia prunelloides |
| Eragrostis gummiflua | Pygmaeothamnus zeyheri |
| Eragrostis nindensis | SANTALACEAE |
| Eragrostis plana | Thesium utile |

SCROPHULARIACEAE

Manulea parviflora

Nemesia fruticans

Sutera caerulea

Sutera neglecta

Tetraselago natalensis

Walafrida densiflora

Zaluzianskya maritima

SELAGINELLACEAE

Selaginella dregei

SOLANACEAE

Solanum panduriforme

THYMELAEACEAE

Gnidia caffra

Gnidia capitata

VERBENACEAE

Verbena bonariensis

Verbena brasiliensis

Verbena tenuisecta

DRAFT
